# 

How the experiences of previous generations can affect who we are

# In other words..

what our parents and grandparents ate, how much exercise they did, and what chemicals they were exposed to, are all factors that could affect how our bodies look and work.

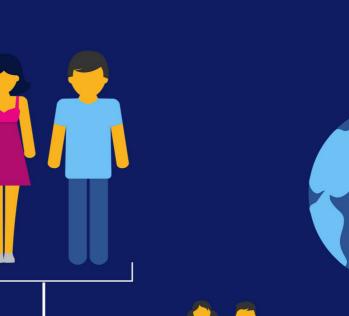

Until recently, all our characteristics were thought to be shaped by two different factors

**Nature** 

The genetic information that we inherit from our mother and father

**Nurture** The influence of our

## **Epigenetics suggests** a combination of these

The life experiences of our parents and grandparents may be passed down.

### **AN EXAMPLE...**

A joint US/European study found that prenatal exposure to famine can lead to epigenetic changes that may affect a person's health later in life.

The research suggests that children conceived during the Dutch Hunger Winter in 1944-45 suffered from persistent bad health six decades later, such as susceptibilities to heart and lung disease, glucose intolerance and other conditions.

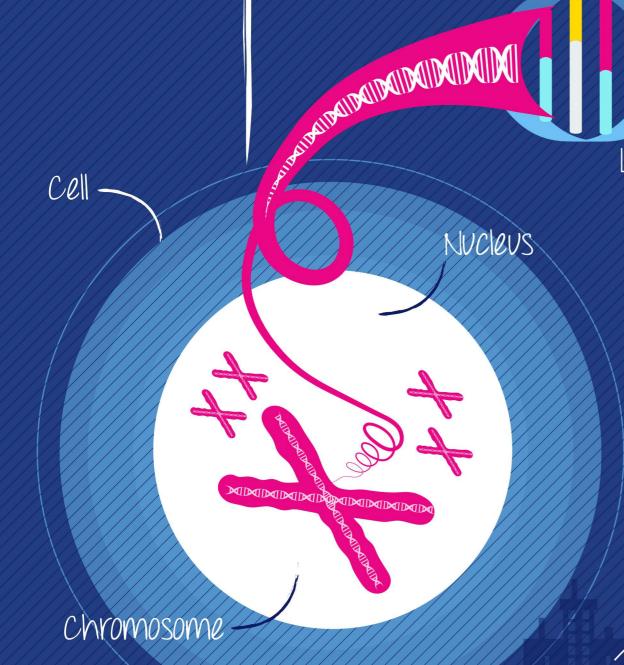

# **HOW DOES THIS HAPPEN?**

outside and how we work on the inside. They act as a set of instructions for our cells, telling

Genes influence what we look like on the

them how to build our bodies. Genes are short sections of DNA.

DNA (double helix)

#### What is DNA?

A chemical molecule binds to a

epigenetic mark that makes an

histone 'tail' and creates an

area of DNA more, or less,

accessible.

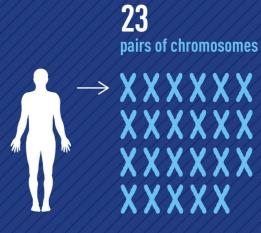

DNA accessible (gene active)

DNA is a long, ladder-shaped molecule, the famous 'double-helix'. Inside our cells, DNA contains all the information needed to make us grow and live. This information is organised into packages called chromosomes.

pairs. One member of the pair comes from our mother and the other from our father.

Humans have 46 chromosomes, organised into

Gene

# How do genes work?

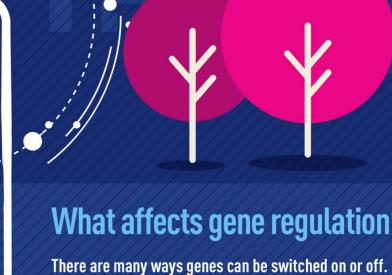

Although all our cells need the same DNA to function, over time, they don't use it all.

Throughout its life, and depending on specific conditions, each cell 'expresses', or switches on, only a selection of its genes. The rest are switched off. This process is known as gene regulation.

**Histones are** proteins around which DNA can wind

DNA inaccessible (gene inactive)

**Histone tail** 

**ARE EPIGENETIC CHANGES PERMANENT?** 

# What affects gene regulation?

Sometimes long-term effects in gene regulation happen as a result of age, environment, lifestyle, or disease.

Some of these changes in gene regulation can be inherited, without altering the information contained in the genes. These changes are known as 'epigenetic markers'.

our DNA before being passed on to the next generation. It now seems that they remain and can be inherited by our children.

We used to think that these changes were erased from

# WHAT ARE THE IMPLICATIONS OF **EPIGENETICS RESEARCH?**

inherited. Scientists are trying to better understand how our environment can leave epigenetic 'marks' in DNA, and how this might have a positive, or negative impact on our health.

There is still much to learn about how acquired characteristics can be

the way our genes are expressed By studying the potential epigenetic effects

We know that nutrition can change

of people's dietary habits, we might be able to help future generations start healthier, and stay healthier for longer.

And so can exercise and

One study, by researchers from Lund

physical activity can cause epigenetic

other lifestyle habits

University in Sweden, found that

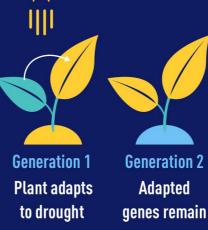

in plants. During droughts, some plants adapt to survive and then pass those adapted genes to the next generation

Although epigenetic changes may be passed from one generation to another, we

know they are dynamic and reversible. This is commonly observed in nature, even

epigenetic changes are usually no longer passed on.

If the next two or three generations don't experience another drought, the

genes remain

'undone' by changes in behaviour or environment.

Scientists believe that the same is true for humans. Epigenetic changes can be

changes in the way cells store fat. **HOW IS NESTLÉ CONTRIBUTING?** 

Before pregnancy

What nutrients are most important for a mother (and a father) to consume to ensure their child has a healthy birth

Nestlé's epigenetics research is primarily focused

on maternal and early life nutrition and health:

**During pregnancy** How can we improve the nutrition

and then throughout life?

After pregnancy What is the optimal nutrition for an

healthy life?

weight and adequate growth?

of future mothers to optimise the health of their children early on,
