C0. Introduction

C0.1

(C0.1) Give a general description and introduction to your organization.

Nestlé is the world’s largest food and beverage company. We have more than 2,000 brands ranging from global icons to local favorites, and we are present in 187 countries around the world. Creating Shared Value is at the heart of Nestlé’s approach to achieving our purpose: to unlock the power of food to enhance quality of life for everyone, today and for generations to come. That’s why we are taking action to advance regenerative food systems at scale. This means supporting the development of food systems that help protect, renew and restore the environment, improve the livelihoods of farmers and enhance the resilience and well-being of farming communities.

Our actions include committing to achieve net zero greenhouse gas emissions by 2050, which is outlined in our Net Zero Roadmap that includes tangible, time-bound targets to reduce emissions, within and beyond our operations. This work is also supported by our Forest Positive strategy, which builds on our decade-long work to end deforestation in our supply chains. Forest Positive is our strategy to move beyond managing deforestation risks in our supply chain to targeting a positive impact on our broader sourcing landscapes. This includes growing 200 million trees by 2030.

In addition, we are signatories of the Ellen MacArthur Foundation Global Commitment on packaging, aiming to make our packaging 100% of recyclable or reusable and to reduce our use of virgin plastics by one-third by 2025. With regards to our work on water, our Nestlé Waters business will advance the regeneration of the water cycle to help create a positive water impact everywhere our waters business operates by 2025. Across Nestlé, we will continue to work to achieve water resource management throughout our operations and agricultural supply chains.

C-AC0.6b/C-FB0.6b/C-PF0.6b

(C-AC0.6b/C-FB0.6b/C-PF0.6b) Why are emissions from agricultural/forestry activities undertaken on your own land not relevant to your current CDP climate change disclosure?

Row 1

Primary reason
Do not own/manage land

Please explain
Nestlé does not directly own or manage any land dedicated to agriculture/forestry.

C-AC0.6f/C-FB0.6f/C-PF0.6f

(C-AC0.6f/C-FB0.6f/C-PF0.6f) Why are emissions from distribution activities within your direct operations not relevant to your current CDP climate change disclosure?

Row 1

Primary reason
Outside the direct operations of my organization

Please explain
Most of our distribution activities (upstream and downstream) are managed by third parties.

C-AC0.7/C-FB0.7/C-PF0.7
Which agricultural commodity(ies) that your organization produces and/or sources are the most significant to your business by revenue? Select up to five.

Agricultural commodity
Other, please specify (Coffee)

% of revenue dependent on this agricultural commodity
20-40%

Produced or sourced
Sourced

Please explain
Coffee is primarily used in our Powdered and Liquid Beverages business, which accounted for approximately 28% of our total revenue in 2021. This business features some of our most iconic brands, such as: Nescafé® and Nespresso®, our premium coffee experience.

Agricultural commodity
Other, please specify (Wheat)

% of revenue dependent on this agricultural commodity
10-20%

Produced or sourced
Sourced

Please explain
Whole wheat is the number one ingredient in many of our products, including breakfast cereal brands like Shreddies® and Nestlé Fitness®. We source cereals and grains from many countries around the world.

Agricultural commodity
Cattle products

% of revenue dependent on this agricultural commodity
10-20%

Produced or sourced
Sourced

Please explain
Dairy is our single biggest category by volume and is sourced from both small- and large-scale producers around the world. Dairy is a major ingredient in the following categories: milk products and ice cream (e.g. Milkmaid), nutrition and health science (e.g. NAN), and confectionery (e.g. KitKat, Cailler).

<td>Board level committee</td>
<td>Nestlé’s oversight of climate-related risks and opportunities is embedded at the highest level of our company. We are continually evolving our corporate governance structure in recognition of the urgency of climate action and in response to our increasing understanding of the impact of climate change on our business. Nestlé’s Board maintains oversight of climate-related issues and monitors progress toward our climate change goals and targets. At Board level, as of the Annual General Meeting 2021, Nestlé split its existing Nomination and Sustainability Committee into a separate Nomination Committee and a dedicated Sustainability Committee. This reflects the importance of sustainability in Nestlé’s corporate governance and allows Board members to dedicate more time and focus to each of these important topics. The Sustainability Committee provides strategic guidance on climate-related matters and reports to the full Board of Directors, which has overall oversight. The Sustainability Committee of the Board meets at least three times per year. It reviews the Company’s commitments on environmental, social and governance aspects as well as the annual Creating Shared Value report and discusses periodically how other material non-financial risks affect the Company’s financial performance and how its long-term strategy relates to its ability to create shared value. An Environmental, Social and Governance (ESG) Sustainability Council has been established at the Executive Board level. The ESG Sustainability Council provides governance, strategic leadership and execution support. It drives implementation of Nestlé’s sustainability strategy, including implementation of our 2050 Net Zero Roadmap, ensuring focus and alignment on execution. In 2021, the Sustainability Committee approved the creation of the ESG and Sustainability Council to replace three previous bodies and make decisions on five key workstreams, including our Net Zero Roadmap. The committee also discussed Nestlé’s attendance at the COP26 UN Climate Change Conference in Glasgow.</td>

C1.2a

(C1.2a) Describe where in the organizational structure this/these position(s) and/or committees lie, what their associated responsibilities are, and how climate-related issues are monitored (do not include the names of individuals).

Nestlé has an Executive Board-level ESG and Sustainability Council. The Council is chaired by the Group’s Executive Vice President (EVP) Head of Strategic Business Units and Marketing and Sales. The ESG and Sustainability Council pulls together the geographical business scopes led by our EVP Zone CEOs and functional leadership at the Executive Board level. It meets every month and regularly reports progress to the full Executive Board. The Council provides governance, strategic leadership and execution support, and drives implementation of Nestlé’s sustainability strategy, including our 2050 Net Zero Roadmap, ensuring focus and alignment.

At an operational level, an ESG Strategy and Deployment Unit has been established. It ensures execution, monitors external developments and defines strategies in support of Nestlé’s sustainability commitments. It coordinates sustainability activities and has oversight of internal sustainability data gathering and external disclosures. It also advises Nestlé’s ESG and Sustainability Council. The ESG Strategy and Deployment Unit reports to the EVP Head of Operations with strategic oversight from the EVP Head of Strategic Business Units and Marketing and Sales. Its work is complemented by other internal departments, including the Public Affairs and ESG Engagement team.

C1.3

(C1.3) Do you provide incentives for the management of climate-related issues, including the attainment of targets?

</tbody>
</table>

(C2.1b) How does your organization define substantive financial or strategic impact on your business?

We run a materiality assessment with external stakeholders every two years. This helps us identify the economic, social and environmental risks that matter most to our business and our stakeholders. For each risk, the materiality assessment rates the degree of stakeholder concern as well as the potential business impact. Our materiality assessment is integrated into the Group’s Enterprise Risk Management process to ensure that wider sustainability risks are incorporated into the risks and opportunities under consideration across the company.

The assessment has a four-level risk rating scale which enables us to categorize the level of impact of each risk:
- Internal stakeholders rate the risk of the risk on Nestlé’s success as major, significant, moderate or negligible
- External stakeholders rate the level of importance of the risk to them as major, significant, moderate or negligible

Both qualitative and quantitative factors are considered when rating a risk:
- does the risk have the potential to substantively affect the Group's strategy or its business model (either at a global level, category level, or across multiple categories)?
- does the risk have the potential to substantively affect one or more of the capitals the Group uses or accesses (e.g. talented, engaged workforce, capital funding)?
- does the risk have the potential to substantively influence the assessments and decisions of stakeholders?

Based on the results of the materiality assessment, we tailor our activities. Nestlé defines as a substantive strategic impact those issues identified as being most material to its business, developing ambitious goals to help advance the health of our planet, drive societal progress and support regenerative food systems. Our ERM risk rating is the metric used to identify change, and the threshold which indicates substantive change is a significant or major risk as opposed to a moderate or negligible risk.

In our most recent materiality assessment in 2020, Climate & decarbonization was identified as one of Nestlé’s material risks, being rated internally as having the potential to have a major impact on Nestlé’s success, whilst external stakeholders rated Climate & decarbonization as being of major importance to them.

To support the Group’s identification and assessment of potential substantive climate-related risks and opportunities, Nestlé is implementing the Taskforce for Climate-related Financial Disclosures (TCFD) recommendations. In 2021, we continued to develop a qualitative and quantitative climate modeling process across our value chain to assess our portfolio’s resilience under different external conditions. We use a climate modelling tool developed with the University of Cambridge’s Centre for Risk Studies. Modeling simulations evaluated the potential directional impacts on Nestlé’s operations and supply chains for both transition and physical risk factors.

**Description of process**

In 2021, we continued to develop our qualitative and quantitative climate modeling process across our value chain to assess the resilience of our direct operations, upstream supply chains and portfolio under different external conditions. We partnered with the University of Cambridge’s Centre for Risk Studies to build a climate modeling tool. Model simulations helped us to identify key climate-related risks and then evaluate their potential directional impacts on Nestlé for both transition and physical risk factors. To help in risk identification, we used the TCFD risk categorization framework described below. In addition, for physical risk identification, we used Cambridge’s Centre for Risk Studies’ Climate Risk Atlas which provides details of and forecasts of future climatic conditions. We considered various climate scenarios covering a broad spectrum of outcomes to help provide insight on the risks & opportunities. The scenarios were built using publicly available data sources, including IPCC and IEA emission pathways. Our current portfolio & value chain were modeled using historical data. The model incorporated Nestlé’s physical and commercial footprint across the upstream and downstream value chain. The original time horizon used was across a period of five years. In 2021, we extended the simulation from 2025 to 2030 for transition risk, and to 2040 for physical risk. The insights from this work further strengthen the importance and relevance of our climate-related actions outlined in our Net Zero Roadmap. Our modeling approach included the potential directional financial impacts on Nestlé for transition and physical risks. The risk categorization was aligned with TCFD recommendations: Transition risks Risks related to shifts in the policy, technology, social and economic landscape that are likely to occur in the transition to a low carbon economy: • Policy • Market • Technology Depending on the nature and, particularly, the speed of the transition, varying levels of financial and reputational risks exist including: • Reduced revenues as consumer demands and preferences shift • Increased costs of doing business • Impacts on asset values • Tangible and intangible asset obsolescence The timing and velocity of the transition risks are uncertain, and more likely to be in the short- to medium-term. Delaying the transition increases the likelihood of a more disorderly, disruptive and abrupt transition. Physical risks Risks related to physical impacts of climate change: • Acute event-driven extreme weather e.g. heatwaves, freeze events, drought, water stress, storms, extreme rainfall, flooding • Chronic longer-term climate shifts, e.g. sustained higher temperatures, sea-level rise Potential impacts considered were: • Direct asset damage to facilities • Indirect impacts including: operational capability e.g. storm surges affecting production, supply chain, health and safety; extended value chain, e.g. water availability affecting sourcing and quality of raw materials On timing: • Acute risks already occur today, we expect the severity and frequency to increase • Chronic risks are more likely to manifest over the longer term, weighted to mid-century and beyond Climate risks and opportunities are included in the scope of our Enterprise Risk Management (ERM) Framework (explained below). The results and learnings of this ongoing work are regularly presented to the Executive Board and Board of Directors. The findings will continue to be integrated into our strategic planning and ERM Framework to help strengthen our resilience, mitigation and adaptation responses. Climate risks and opportunities are included in the scope of our ERM Framework, processes and reporting. Climate analysis is a rapidly evolving area and we intend to run the scenario analysis on an annual basis updating for key external and internal changes. A top-down assessment is performed at Group level once a year to create a good understanding of the company’s key potential risks (which include climate-related ones), to allocate ownership to drive specific actions around them and take any relevant steps to address them. The identification includes an assessment of the external and internal environment in which the company operates, with climate-related risks and opportunities included in the risk universe considered. An example of transition risk considered was carbon pricing under the policy dimension. We split the world into leaders, fast followers and laggards to assess our potential exposure to carbon pricing in terms of pricing level, timing and geographic regions. Carbon price mechanisms have the potential to increase our operational costs, either directly (e.g. increase in direct energy costs) or indirectly (e.g. increase in supplier energy costs which are passed on to Nestlé). We overlaid our GHG physical footprint on this analysis to evaluate our potential risk exposure under different climate transition pathways. This helps to provide insights into decision-making and prioritization of where and when we should target our carbon reduction efforts. Physical changes in climate may affect Nestlé’s supply of critical raw materials, potentially impacting yields, variability of supply and quality. An example of a physical risk considered was higher temperatures and water shortages compromising coffee quality and coffee supply for our coffee brands. This may lead to higher volatility of coffee prices and may have economic and social impacts on coffee-growing communities. Using the climate model, we attempted to quantify the potential yield reduction of arabica and robusta associated with extreme temperatures and drought events. Over a five-year outlook, the risk is relatively low. Considering a longer-term outlook, the impacts are likely to increase both in severity and frequency. Given this, we have initiatives in place to support farmers and our business in mitigating and adapting to climate-related physical risks. These include providing technical assistance to help increase farmers’ resilience through our Nescafé Plan and Nespresso AAA Program, such as the development and distribution of plantlets that are more resistant to drought and disease.

**Description of process**

Property Loss Prevention Program (i.e. production sites, warehouses, distribution sites etc.) The Nestlé Global Property Loss Prevention Program is managed centrally by Nestlé’s corporate Group Risk Services department which provides an in-depth identification of exposures to property risks including potential risks such as floods, windstorms, interruption of supply etc. In general, our 354 factories are assessed every three years by an independent assessor. In 2021, 161 sites were assessed (vs 211 initially planned but not performed due to Covid-19) and reported on including recommendations to prevent and minimize damage and loss to physical assets. The identification process includes use of structured techniques, e.g. flow-charting, system analysis, fault tree studies or operational modelling, or more general techniques e.g. ‘what-if’ and scenario analysis. The identification of what may pose a risk/opportunity is documented, including the trigger effect, controls in place and their level of efficiency. This is supported by an expert team of engineers. This enables us to form decisions about the future standards of prevention and protection.
Which risk types are considered in your organization’s climate-related risk assessments?

<table>
<thead>
<tr>
<th>Current regulation</th>
<th>Relevance</th>
<th>Please explain</th>
</tr>
</thead>
<tbody>
<tr>
<td>Relevant, always included</td>
<td>Compliance with existing climate-related regulations. Potential impacts of non-compliance may include reputational damage, revenue losses, fines etc. Nestlé aims for its investments to benefit both for our shareholders and people in the countries where we do business by supporting multiple global principles and goals, including the UN Sustainable Development goals (of which Nestlé is a signatory) to set a framework for sustainable business practices. It is essential to ensure that our operations and activities do not harm the environment or society. The UN Sustainable Development Goals (SDGs) provide a common framework for guiding actions towards achieving a sustainable future for all. Nestlé supports the SDGs through its commitments to conduct business in an environmentally responsible and socially sustainable manner, and to contribute to the achievement of the SDGs. This includes aligning its operations with the SDGs, monitoring progress against targets, and reporting on progress made towards achieving SDG targets. Nestlé is committed to contributing to the achievement of the SDGs through its operations and by supporting initiatives that contribute to achieving the SDGs. We believe that doing so is essential for the long-term success and sustainability of our business. Nestlé works closely with various stakeholders, including governments, organizations, and individuals, to support initiatives that contribute to the achievement of the SDGs. We believe that working together in a collaborative manner is essential to achieving the SDGs.</td>
<td></td>
</tr>
</tbody>

Emerging regulation | Relevant, sometimes included | Where known, emerging climate-related regulation which may impact the business should be assessed in terms of impact and likelihood. Any risk of potentially failing to meet new requirements should be assessed in terms of impact and likelihood. The impact of climate change is a significant risk for businesses, and it is essential to assess the potential impacts of emerging climate-related regulation. Nestlé monitors and assesses emerging climate-related regulation to ensure that it is prepared to respond to new requirements as they emerge. Nestlé aims to be proactive in addressing emerging climate-related regulation in order to minimize the risks and capitalize on opportunities. For example: Nestlé is working to make its net zero commitment a reality. Nestlé is committed to achieving net zero emissions by 2050 and to working towards climate neutrality by 2030. Nestlé is also committed to reducing its carbon footprint through various initiatives, including: a) reducing emissions from its operations, b) reducing emissions from its supply chain, c) investing in renewable energy and carbon capture and storage technologies, d) supporting research and development in climate change mitigation and adaptation technologies, and e) engaging with stakeholders to promote climate action. Nestlé believes that achieving its net zero commitment will require a comprehensive approach, involving all aspects of its business, including operations, supply chain, and innovation. Nestlé is committed to working with its suppliers, customers, and other stakeholders to achieve its net zero commitment. Nestlé will continue to monitor and assess emerging climate-related regulation to ensure that it is prepared to respond to new requirements as they emerge. Nestlé aims to be proactive in addressing emerging climate-related regulation in order to minimize the risks and capitalize on opportunities. | |

Technology | Relevant, always included | Failure to effectively develop and adopt new technologies e.g. packaging formats, clean energies may lead to the company failing behind competition, breaching regulations or failing to meet consumer expectations. These types of risks and opportunities are identified through the Enterprise Risk Management process at market, function and group levels where relevant, to minimize impacts and capitalize on opportunities. For example: Nestlé is working to make its net zero commitment a reality. Nestlé is committed to achieving net zero emissions by 2050 and to working towards climate neutrality by 2030. Nestlé is also committed to reducing its carbon footprint through various initiatives, including: a) reducing emissions from its operations, b) reducing emissions from its supply chain, c) investing in renewable energy and carbon capture and storage technologies, d) supporting research and development in climate change mitigation and adaptation technologies, and e) engaging with stakeholders to promote climate action. Nestlé believes that achieving its net zero commitment will require a comprehensive approach, involving all aspects of its business, including operations, supply chain, and innovation. Nestlé is committed to working with its suppliers, customers, and other stakeholders to achieve its net zero commitment. Nestlé will continue to monitor and assess emerging climate-related regulation to ensure that it is prepared to respond to new requirements as they emerge. Nestlé aims to be proactive in addressing emerging climate-related regulation in order to minimize the risks and capitalize on opportunities. | |

Legal | Relevant, always included | Compliance with climate-related legal requirements is non-negotiable for Nestlé and therefore the expectation is that areas where a breach could result, must be captured in risk assessments. For example: regulation bans/limits on certain products/categories to reduce waste, greenhouse gas emissions and pollution. Packaging helps keep our food safe and prolong its shelf life but if not properly disposed of, it can be source of waste. Packaging itself can be a significant source of greenhouse gas emissions, comprising around 10% of the greenhouse gas emissions baseline in our Net Zero Roadmap. The EU Single Use Plastics Directive introduces, inter alia, new requirements related to packaging design, collection targets, labelling and Extended Producer Responsibility. This law will impact some of Nestlé’s categories. We are signatories of the Ellen MacArthur Foundation Global Commitment on packaging, aiming to make all packaging 100% recyclable or reusable by 2025, and to reduce our use of virgin plastics by one third by 2025 and 49% of our plastic packaging is recyclable or reusable as per the EMF Commitment. Tackling this challenge requires a wide range of actions and we are accelerating our efforts. | |

Market | Relevant, always included | Given the growing concern with regards to the sustainability of the earth’s resources and the impact that humans have on the environment, there is increasing awareness and scrutiny from consumers and customers about our products across the full value chain. Consumer behaviors and requirements may no longer be met by certain categories/product groups and key customers may also seek to re-evaluate their offerings in order to meet changing demands. These types of risks are captured and managed in the Market Enterprise Risks assessment e.g. responsible sourcing, traceability of ingredients, organic raw materials, sustainable packaging (e.g. bio-degradable, recyclability), waste generation etc. The Markets report their risks to HQ and these risks are consolidated to provide the Markets’ perspective for the Executive Board. Example: reducing waste and related GHG footprint. Sector or business-level reputation may be impacted (positively or negatively depending on the category) by shifts in consumer sentiment with respect to product packaging (including plastics). Collaborating with external partners will likely help respond to consumer demand for more sustainable packaging such as plastic waste. Nestlé engages with external partners to develop and implement sustainable packaging solutions and to increase access to disruptive ideas, technologies and business models. Packaging must be fit to meet local circumstances, whether we are innovating for protection in hot and humid climates, designing packaging that can be recycled through local infrastructure or focusing on preventing materials leakage where infrastructure does not exist. This is why our packaging commitments are developed on a regional basis. Selected countries serve as models for our markets and zones, ensuring packaging delivers safe and nutritious food, while adapting to different product and geographic contexts. We are aware of the links that exist between packaging waste, climate change and biodiversity. That is why our packaging commitments form part of our Net Zero Roadmap. | |

Reputation | Relevant, sometimes included | In line with our purpose and values, maintaining and building trust with respect to our corporate name and our brands is critical to strategic success. Examples of potential risks are linked with sourcing of palm oil and deforestation, impact of intensive farming and land use, etc. Potential risks include climate-related risks that may lead to reputational risks are managed by the Issues Round Table (IRT), both at a Market and at Group level. The IRT prioritizes risks on a heatmap and this heatmap is considered as an input into the annual Enterprise Risk Management assessment carried out by each Market and at a Group level. Additionally, we consider collective action and partnerships are key to contributing effectively and help to maximize what we can achieve. We believe we can achieve this goal by aligning our operations and strategies with 10 universally accepted principles covering human rights, labor, environment, and anti-corruption. As a lead member of the UN Global Compact, Nestlé continues to further its work towards advancing the integration of sustainability principles into our core business operations. We consider these multi-stakeholder groups crucial in the development of a standardized framework with common indicators, and were appropriate support. Example: engaging stakeholders on regenerative food systems. Sector or business-level reputation may be impacted (positively or negatively depending on the category) by shifts in stakeholder and consumer sentiment with respect to sustainability. At the same time, transforming food systems is key for society to address urgent climate-related challenges and achieve the Sustainable Development Goals. With this in mind, on September 16, 2021, we hosted an online stakeholder dialogue to launch our new plan to advance regenerative food systems at scale. For Nestlé, this marked the beginning of ongoing stakeholder engagement on how to work on this plan and the challenges involved. The event brought together representatives of civil society organizations and multilateral institutions, policy makers, business leaders, farmers, and Nestlé staff, including executive board members, to discuss topics such as ‘Regenerative food systems: what is needed for a just transition?’. Our stakeholders highlighted important themes for further investigation and guidance on what matters to farmers, consumers and investors. | |

Acute physical | Relevant, sometimes included | Chronic physical risks are considered e.g. changes in precipitation patterns, extreme variability in weather patterns and rising mean temperatures which may affect when, where and what type of crops can be grown. This potentially can lead to reduced sales revenue/output, increased operating costs, increased capital costs (e.g. damage to facilities). Additionally, ensuring longer-term food security is a challenge as population growth leads to increases in consumption and pressure on natural capital including water, land, natural habitats. In terms of resource management, approximately one third of global food production is wasted or lost each year and would be the world’s third-largest carbon emitter if it were a country (source: Food and Agriculture Organization). These trends will cut across our sphere of influence and span our entire value chain. Various of Nestlé’s corporate teams (Agriculture, technical teams of the Strategic Business Units and Regional Businesses) assess these chronic potential risks for key agricultural materials. These assessments are used to inform our priorities and actions on our Net Zero Roadmap including adaptation, mitigation and advocacy. | |

C2.3a) Which risk types are considered in your organization’s climate-related risk assessments?
Yes

C2.3a) Provide details of risks identified with the potential to have a substantive financial or strategic impact on your business.

Primary potential financial impact
Decreased revenues due to reduced production capacity

Climate risk type mapped to traditional financial services industry risk classification
<Not Applicable>

Company-specific description
Extreme weather events can reduce the productivity of business activities and add costs to operations and processes. Events with contrasting characteristics impact businesses in various ways. Typically, storms and floods are destructive and cause significant physical capital losses, while extreme temperature waves disrupt productivity. The effects of extreme weather on business activities can include direct physical damage or destruction of physical assets, including property, plants, equipment, and inventory. The severity of such impacts is typically measured in terms of the total cost of destroyed physical assets, usually as a repair cost, reconstruction estimate, or lost value of damaged property. Operational disruption can result in the loss of productive output, either if the means of production are directly disrupted, for example through transportation and supply chain interruption, energy and utility outages, or productivity is reduced in the workspace. For example, one of our largest coffee factories is exposed to tropical storms which may lead to direct asset damage as well as flooding. By modelling potential extreme weather hazards, we can identify where we have significant exposures to target mitigation including business continuity plans. To assess physical risks until 2040, we focused on impacts from extreme weather events including extreme temperature, water stress, storms and flooding risks. Extreme weather affects our value chain today, and the impacts represent the differential between the current run rate of impacts and the 2040-forecasted level. We undertook climate scenario analysis to quantify the change in expected (i.e. probability weighted) physical impacts on Nestlé’s key facilities until 2040. The University of Cambridge’s Centre for Risk Studies’ Climate Risk Atlas was applied to assess the exposure of each key Nestlé facility to various hazard types. The model quantified the aggregate risk of multiple extreme weather threat types. The model provided a range of Nestlé’s extreme weather exposure attributed to facility disruption risk.

Low

Are you able to provide a potential financial impact figure?
Yes, an estimated range

Potential financial impact figure (currency)
<Not Applicable>

Potential financial impact figure – minimum (currency)
30000000

Potential financial impact figure – maximum (currency)
300000000

Explanation of financial impact figure
The risk of floods and windstorms is a natural hazard exposure known by the company. When they are rated high, these hazards are assessed as part of the Property Loss Prevention Program. The highest Probable Maximum Loss is estimated to be between CHF 30 and 50 million for windstorms and CHF 250 and 300 million for floods

Cost of response to risk
17600000

Description of response and explanation of cost calculation
At Nestlé we take a comprehensive approach to assess and mitigate risk related to changes in physical climate parameters that could result in our operations disruptions. The management methods used include: i) In 2021, risk engineer experts inspected 169 Nestlé sites providing recommendations for improving standards of prevention to flooding, when relevant. ii) The Nestlé Global Property Loss Prevention Programme provides a consistent view of our exposure to property risks around the world to floods and storms, enabling us to make informed decisions about the future standards of prevention and protection throughout Nestlé sites when relevant. iii) Emergency plans for flood and storms are in place on a case-by-case in Nestlé sites exposed to these perils from any source. The costs associated with these actions include the Loss Prevention Program and specialist engineers visiting the sites which amounted to CHF 1.6 million in 2021. These costs include site visits, project reviews in terms of fire and natural hazard exposures and recommendations by specialists and cover the identification and mapping of risks at site level. Higher investments are committed by operations, which ultimately follow-up on the risks identified and implement the suggested preventive measures identified throughout the assessments. In terms of implementation cost of the recommended measures, the annual average cost recently recorded in a system shows an actual cost of approximately CHF17.6 million. This corresponds to the implementation cost of the recommendations made by our main insurer without considering the costs of response to the risk. It does not include all the protection system implemented during large projects (i.e. new production line, greenfield projects). This is only the implementation cost of the recommendations made during the regular loss prevention visits. The cost of response is in total approx. CHF19.2m for implementation of recommendations and the loss prevention program.

Where in the value chain does the risk driver occur?
Direct operations

Risk type & Primary climate-related risk driver
Emerging regulation  Carbon pricing mechanisms

Primary potential financial impact
Increased indirect (operating) costs
Climate risk type mapped to traditional financial services industry risk classification
<Not Applicable>

Company-specific description
Carbon pricing is considered a fundamental mechanism through which governments may incentivize the transition to a decarbonized economy, including for food & beverage companies like Nestlé. The pace and nature of how carbon price mechanisms may evolve is uncertain. The financial impact is that businesses may have to pay a price for carbon they emit across their value chain subject to the carbon price mechanisms of the jurisdictions they operate in. This may include: - Scope 1 direct emissions from Nestlé-owned sources - Scope 2 indirect emissions from the consumption of purchased electricity, heat or steam - Scope 3 other indirect emissions from upstream or downstream sources e.g. suppliers passing on carbon price impacts to Nestlé. Currently, 4.8% of Nestlé's Scope 1 emissions are covered by the EU Emissions Trading Scheme and we are required to purchase EU-ETS carbon allowances when measures such as improving energy efficiency and switching to cleaner fuels do not provide the necessary reductions. Ingredients, and specifically dairy and livestock ingredients, are Nestlé’s largest single source of emissions. Therefore mitigating this financial impact and charting a course to net zero means driving a major shift in the way Nestlé sources these ingredients, by investing in innovations and new business models.

Time horizon

Are you able to provide a potential financial impact figure?
Yes, an estimated range

Potential financial impact figure (currency)
<Not Applicable>

Potential financial impact figure – minimum (currency)
4000000000

Potential financial impact figure – maximum (currency)
7000000000

Explanation of financial impact figure
We assessed this policy dimension through our climate scenario analysis. We made the following assumptions: - Three climate scenario pathways were considered: “high emissions” (approx. in line with RCP8.5), “intermediate emissions” (approx. in line with RCP4.5), and “low emissions” (approx. in line with RCP2.6). - Policies are determined at national or sub-national levels of governance, reflecting the difficulties in mandating a global agreement, although some international coordination is expected. - Price is variable between countries, countries are categorized, primarily by income level, into climate policy leaders (started transition, high ambition), followers (emerging initiatives, international power plays key), and laggards (prioritize socioeconomic development, limited ambition). - Time horizon was up until 2030. - Projected increases in global average carbon price to 2030 were made for each climate scenario. Values were taken from the World Bank Carbon Pricing Dashboard. Scenario projections are aligned with a series of published carbon prices from established sources, including the IMF, PRI, and IEA, based on estimated requirements to stimulate and achieve emissions reduction in line with the pathways. Based on this external data, the carbon price assumptions for each scenario were: - "Low emissions” 2030 carbon price of USD140/tonne - "Intermediate emissions” 2030 carbon price of USD75/tonne - "High emissions” 2030 carbon price of USD40/tonne The impact is that businesses may have to pay a price for the carbon they emit across their value chain subject to the carbon price mechanisms of the jurisdictions they operate in. This may include scope 1, scope 2, and scope 3. The financial implications for Nestlé of carbon pricing was modelled until 2030 under the climate scenarios. The potential financial impact range for Nestlé is estimated at CHF4.7 billion cumulative until 2030 and is based on the 1.5 scenario. In terms of GHG emissions, it assumes efforts to reach net zero greenhouse gas emissions by 2050. It requires the world to take immediate and coordinated action to tackle climate change and curb emissions with an estimated carbon price in 2030 of USD140/tonne. For the other scenarios: - "Intermediate emissions” potential financial impact range for Nestlé is estimated CHF1 – 4 billion cumulative to 2030 - "High emissions” potential financial impact for Nestlé is estimated to be less than CHF1 billion cumulative to 2030

Cost of response to risk
3200000000

Description of response and explanation of cost calculation
We aim to reduce the risk of carbon taxes by working toward the milestones in our Net Zero Roadmap. We are accelerating work to reduce emissions in our manufacturing, packaging and brands. We’re also investing CHF 1.2 billion to help spark regenerative agriculture across our supply chain. In total, we plan to invest CHF 3.2 billion by 2025 in our Net Zero Roadmap. The CHF 3.2 billion investment comprises projects across our value chain, particularly focused on the upstream value chain working with farmers, suppliers and communities to reduce emissions. Dairy and livestock ingredients are our largest single source of emissions. Charting a course to Net Zero means driving a major shift in the way we source and produce these nutritious ingredients, investing in innovations and new business models. For dairy and livestock supply chain emissions, our ambition is to reduce GHG emissions by 21.3 million tonnes CO2e. This represents 23% of our in-scope 2018 carbon footprint. The key drivers of the plans are: 1. Making farms more productive through training and better herd management 2. Caring for grassland to store more carbon by using regenerative agriculture and organic fertilizers 3. Cutting the methane produced by animals during digestion through nutrition change 4. Feeding livestock with more sustainable feed As a result of GHG reduction projects being scaled up in our operations and supply chain, we have put peak carbon behind us following two consecutive years of emissions reductions, while our business has grown. We reduced absolute GHG emissions by 4.0 million tonnes through Nestlé projects in 2021. Looking to 2050, we will continue to support family-operated farming systems through regenerative agricultural practices aimed at reducing the carbon footprint of dairy farming. Activities will also include investing in partnerships to develop technologies to help take farming to the next level of sustainability.

Where in the value chain does the risk driver occur?
Downstream

Risk type & Primary climate-related risk driver
Market Changing customer behavior

Primary potential financial impact
Decreased revenues due to reduced demand for products and services

Climate risk type mapped to traditional financial services industry risk classification
<Not Applicable>
Company-specific description
Dietary shifts – particularly toward plant-based diets – are one of the measures that we, as a global community, can take to keep our food system within environmental limits. Trends show growing consumer demand for low-carbon products such as plant-based foods and drinks. Demand for products and services may be impacted as consumers switch to sustainable alternatives and innovative competitors emerge that challenge market share. If Nestlé does not anticipate and act on these changing consumer shifts, it has the potential to impact on Nestlé’s revenues and market shares. We assessed this market dimension through our climate scenario analysis. We considered the potential uptake rates of sustainable alternatives based on the proportion of consumers transitioning to products and services with a lower carbon footprint. We also considered other variables including the socioeconomic dynamics of individual markets and the product portfolio in key markets. Variable rates of adoption were projected across the different climate scenarios considered. Revenue impacts were modelled in each year up to 2025. The model estimated potential directional financial impacts for each climate scenario considered. Our core strategy is in line with these consumer shifts and that means engaging the one billion consumers a day who buy our products by offering more foods and beverages that are nutritious and have a lower carbon footprint. We aim to continuously reduce the environmental footprint of our ingredients and recipes and investigate ways to transparently communicate about it. By engaging with consumers, we can increase demand for these products, which in turn should help us toward our Net Zero ambition.

Time horizon
Medium-term

Likelihood
About as likely as not

Magnitude of impact
Medium

Are you able to provide a potential financial impact figure?
Yes, an estimated range

Potential financial impact figure (currency)
<Not Applicable>

Potential financial impact figure – minimum (currency)
400000000

Potential financial impact figure – maximum (currency)
700000000

Explanation of financial impact figure
The directional impact range is based on the climate scenario analysis in 2021. The impact of CHF 4-7 billion is cumulative up until 2030 and is based on the “low emission” +1.5C climate scenario. For the other climate scenarios considered the estimated directional cumulative impacts until 2030 were: High emissions: +4-5C - low impact, less than CHF 1bn Intermediate emissions: +2.5C – medium impact, CHF 1-4 billion Modeling approach and assumptions: - Considered various climate scenarios covering a broad spectrum of outcomes to help provide insight into risks and opportunities. - Scenarios were built using publicly available data sources, including IPCC and IEA climate emission pathways. - Our current portfolio and value chain were modeled using historical data. The potential impact of actions planned by Nestlé in our Net Zero Roadmap were not contemplated. - Model incorporated Nestlé’s physical and commercial footprint including: volumes and sourcing locations of raw materials, facility locations and distribution of finished goods; sales and profit by market. - Time horizon used was a medium-term outlook of five years. In the longer-term (10 years+), risks are highly uncertain and unpredictable, particularly in the context of how the transition to a lower-carbon economy may evolve. - Given complexity of how risks may influence others, each risk factor was modeled independently, not contemplating dependencies or trade-offs between them.

Cost of response to risk
320000000

Description of response and explanation of cost calculation
We aim to reduce the risk of decreased revenues due to reduced demand for products and services by working toward the milestones in our Net Zero Roadmap. As consumers demand increasingly sustainable products, our brands will continue to adapt, embracing sustainability. Our strategy is in line with this shift and that means engaging the one billion consumers a day who buy our products by offering more foods and beverages that are nutritious and have a lower carbon footprint. We aim to continuously reduce the environmental footprint of our ingredients and recipes and investigate ways to transparently communicate about it. By engaging with consumers, we can increase demand for these products, which in turn will help us toward our Net Zero ambition. Our Net Zero Roadmap includes transformation of our product portfolio. We are accelerating work to reduce emissions in our manufacturing, packaging and brands. We’re also investing CHF 1.2 billion to help spark regenerative agriculture across our supply chain. In total, we plan to invest CHF 3.2 billion by 2025 in our Net Zero Roadmap. Initiatives include: Transforming our portfolio • Acceleration of innovation to lower the carbon footprint of our recipes • Switching to plant-based ingredients – specifically in our frozen meals, pizzas and dairy categories Evolving our packaging • Continuing to invest in packaging innovations, alternative delivery systems and new business models that help stop waste going to landfill or ending up as litter, and reduce carbon emissions Carbon neutrality • Individual brands achieving product or brand carbon neutrality to meet growing market preferences for more transparent and sustainable products • Use of high-quality, verified offsets and insets Case study: In addition to the carbon reductions and removals in our value chain, in the short-to-medium term some of our brands are investing in carbon credits to compensate for emissions relating to their products. We purchase high-quality carbon credits that help fund natural climate solutions and other activities outside our value chain, including tree planting, forest protection and, in some cases, social programs for rural communities. Brands can communicate the resulting carbon neutral status to consumers – as long as they can prove the GHG reduction and commit to significantly and progressively reducing their GHG emissions in line with the Net Zero Roadmap.

C2.4

(C2.4) Have you identified any climate-related opportunities with the potential to have a substantive financial or strategic impact on your business?
Yes

C2.4a

(C2.4a) Provide details of opportunities identified with the potential to have a substantive financial or strategic impact on your business.

Identifier
Opp1

Where in the value chain does the opportunity occur?
Company-specific description

With the ambition of the Paris Agreement, more organizations and governments are looking to put a price on carbon; our business might be exposed to future regulation change around carbon price/tax with potential increasing operating costs. Today we have nine facilities in Europe that participate and comply with EU-ETS Phase III. However, we have 354 factories located in more than 80 different countries. While in some of those regions a carbon pricing system already exists even though our industrial sector has not been subjected to any so far, the number of emissions trading programs is likely to expand. The company-specific opportunity for Nestlé is that working toward our Net Zero ambition may give us a competitive advantage versus some of our competitors that may not implement GHG emissions reductions at the same speed, and may be therefore highly exposed to regulatory changes and increased operational costs due to carbon price.

Time horizon
Medium-term

Likelihood
More likely than not

Magnitude of impact
Low

Are you able to provide a potential financial impact figure?
Yes, an estimated range

Potential financial impact figure (currency)
<Not Applicable>

Potential financial impact figure – minimum (currency)
20000000

Potential financial impact figure – maximum (currency)
30000000

Explanation of financial impact figure
By reducing GHG emissions, we reduce our exposure to potential carbon price mechanisms. As an estimation of the annual financial impact of the opportunity: we use the GHG reductions in our operations (scope 1+2) from our 2018 baseline calculation of 5.8mt CO2e as at 2030 to be aligned with Paris 1.5°C decarbonization pathway and Net Zero Roadmap. We should have approximately halved 2018 GHG emissions 0.5 x 5.8 million t CO2e = 2.9 million t CO2e Assuming that all our plants have to comply with a regulatory carbon price in 2030 and a global average price of carbon in 2030 of between USD 100 - 140 per ton of CO2e, this would represent a savings of between USD 200 - 300 million per year. The figure will vary depending on evolution of GHG Scope 1 & 2, level of carbon pricing and geographic spread implementation of carbon pricing as well as our ability to achieve our internal targets.

Cost to realize opportunity

Strategy to realize opportunity and explanation of cost calculation
We are accelerating efforts in our manufacturing and operations to reduce emissions as part of our company-specific Net Zero Roadmap. By 2025, we aim to purchase 100% renewable electricity in all our sites. The specific actions we are focusing on: - Power our manufacturing renewably by increasing the proportion of renewable electricity that we use through power purchase agreements, green tariffs, renewable energy certificates and on-site production. Alongside established forms of renewable electricity, such as wind and solar, we will work with suppliers to increase availability of renewable thermal energy generated from sources, e.g. biogas and biomass by 2030. In 2021, we increased the percentage of renewable electricity sourced to 63.7% (2020: 50.5%), in line with our commitment to source 100% renewable electricity across our sites globally by 2025. The increase was due to many sites in Argentina, Australia, Mexico, New Zealand and Russia achieving 100% renewable electricity. - Further emissions reductions are expected to be delivered by increasing the efficiency of our operations. Many energy efficiency projects are already planned for sites across the globe, ranging from LED lighting systems to optimizing energy consumption during non-production times and recovering heat energy. - Phase out refrigerants with a high global warming potential, such as hydrofluorocarbons, in our industrial refrigeration systems. We plan to replace these with new, natural refrigerants with zero or low GWP, such as ammonia, CO2 and hydrocarbons. Financial forecasts including forecasted costs are business sensitive and not publicly disclosed.

Opportunity type
Products and services

Primary climate-related opportunity driver
Shift in consumer preferences

Primary potential financial impact
Increased revenues resulting from increased demand for products and services

Company-specific description
Trends show growing consumer demand for low-carbon products such as plant-based foods and drinks. An engaged generation of consumers is driving a new food ideology, with trends toward more natural and organic foods, plant-based proteins and simpler, healthier ingredients. They expect brands to provide experiences beyond the product, be authentic and act as a force for good – both socially and environmentally. Plant-based products should be delicious, offer a better nutritional profile and have a lower environmental footprint compared to meat. Company-specific description of this opportunity: Our relentless dedication to innovation allows us to deliver on consumer preferences time and time again. We focus on exploring trends, rapidly converting ideas into products and testing their relevance with consumers and customers. Through our strong innovation capacity, we have significantly invested in plant-based products, launching Garden Gourmet brand’s Sensational Burger and Sensational Vuna, our vegan tuna alternative, in Europe. We continue to upgrade our plant-based offering in terms of taste, texture, flavor and nutrition. We also leverage our expertise in plant protein to expand our dairy-alternative offerings. In 2021, vegetarian and plant-based food offerings continued to see strong double-digit growth (more specific financial
Are you able to provide a potential financial impact figure?
No, we do not have this figure

Potential financial impact figure (currency)
<Not Applicable>

Potential financial impact figure – minimum (currency)
<Not Applicable>

Potential financial impact figure – maximum (currency)
<Not Applicable>

Explanation of financial impact figure
We are offering more plant-based food and beverage options to enable us to be the consumers’ preferred choice as they diversify their diets. In 2021, launches included Garden Gourmet’s Vrimp – a new, plant-based seafood alternative, vEGGie, a nutritious, vegan tasty alternative to conventional eggs that contains soya protein and omega-3 fatty acids, and Wunda, a new range of pea-based milk alternatives. Vegetarian and plant-based food offerings continued to see strong double-digit growth. Financial forecasts are business sensitive and not publicly disclosed.

Cost to realize opportunity
Strategy to realize opportunity and explanation of cost calculation
Transforming our product portfolio includes lowering the carbon footprint of our recipes. Our process of constant improvement is a competitive advantage, reducing our carbon footprint while continuing to contribute to healthy and nutritious diets. As a company-specific example, we are rapidly expanding our plant-based range to meet significant increases in consumer demand. In 2021, we launched Garden Gourmet’s Vrimp – a new, plant-based seafood alternative, vEGGie, a nutritious, tasty alternative to conventional eggs that is vegan and contains soya protein and omega-3 fatty acids, and Wunda, a new range of pea-based milk alternatives, is made with yellow peas that provide high-quality protein and offer strong nutritional value. Our ambition by 2030 is to reduce future GHG emissions by 6 million tonnes CO2e through transforming our product portfolio. The key drivers of this are: 1. evolving product offerings (estimated -4.2m CO2e tons) e.g. our the Garden Gourmet and Wunda products launched in 2021. 2. shifting towards ingredients with lower carbon footprint like plant-based foods (estimated -1.4m CO2e tons) e.g. Milo replaces milk powder with ingredients from soy and oats, the core ingredients are the same as original Milo – malt, barley and cocoa e.g. our plant-based Coffee Mate natural bliss creamers that come in a variety of bases like almond and oat milks. We aim to continue to expand our plant-based know-how to meet new consumer needs as well as helping meet our Net-Zero ambition.

Comment

Where in the value chain does the opportunity occur?
Downstream

Opportunity type
Products and services

Primary climate-related opportunity driver
Development and/or expansion of low emission goods and services

Primary potential financial impact
Increased revenues resulting from increased demand for products and services

Company-specific description
As consumers demand increasingly transparent and sustainable products, our brands will continue to adapt, embracing sustainability. Our company-specific core strategy is in line with this shift and that means engaging the one billion consumers a day who buy our products by offering more foods and beverages that are nutritious and have a lower carbon footprint. We aim to continuously reduce the environmental footprint of our ingredients and recipes and investigate ways to transparently communicate about it. By engaging with consumers, we can increase demand for these products, which in turn will help us toward our Net Zero ambition. Our company-specific Net Zero Roadmap includes transformation of our product portfolio. In parallel with our corporate Net Zero emissions pledge, individual Nestlé brands are on a journey to achieving product or brand carbon neutrality. Our initiatives include: Our Net Zero Roadmap, which was launched in December 2020 with targets approved by the Science Based Targets initiative (SBTi). Historically, we have focused on emissions that are produced within our own factories (Scope 1), as well as those related to the electricity we purchase and use in our facilities (Scope 2). In our ambition of net zero emissions by 2050, we now address emissions throughout our value chain. As the majority of our emissions come from activities in our supply chain (Scope 3), that is where we are focusing efforts, collaborating with various partners to achieve our goals. The power of our products is key to driving industry action. In addition to the carbon reductions and removals in our value chain, in the short-to-medium term some of our brands are investing in carbon credits to compensate for emissions relating to their products. We purchase high-quality carbon credits that help fund natural climate solutions and other activities outside our value chain, including tree planting, forest protection and, in some cases, social programs for rural communities. Brands can communicate the resulting carbon neutral status to consumers – as long as they can prove the GHG reduction and commit to significantly and progressively reducing their GHG emissions in line with the Net Zero Roadmap.

<td>Transition scenarios</td>
<td>Company-wide</td>
<td>Scenarios analysis allows us to better understand the impact of climate change and how it could affect our company. It is a critical tool for strategic and financial planning and risk management. In 2021, we continued to strengthen our methodology and tools to identify, assess and manage our climate risks and opportunities. Modeling simulations evaluated the potential directional impacts on Nestlé for both transition and physical risk factors. We partnered with Re storyline using methodology and scenarios from their academic partner, the Centre for Risk Studies at the University of Cambridge Judge Business School. We assess two types of risk: transition risk and physical risk. In 2020, we assessed our resilience over a five-year time horizon under different external conditions. In 2021, we extended the simulation from 2025 to 2040 for transition risk. The insights from this work further strengthen the importance and relevance of our climate-related actions outlined in our Net Zero Roadmap. Transition risk is related to the nature, pace and timing of decarbonization of the global economy. The pathway to reduce emissions may be gradual and managed or may be halted and abrupt. Therefore, to analyze transition risk, we used three different scenarios, based on low-, intermediate- and high-emission pathways: • Low-emission pathway: Immediate and coordinated action to curb emissions limit warming to 1.5°C by 2100. • Intermediate pathway: Reliance on existing planned policies leads to warming of +2°C to +3°C by 2100. • High-emission pathway: Few or no steps taken to limit emissions lead to warming of +4°C to +5°C by 2100. Scenarios were based on existing published scenarios, including the Intergovernmental Panel on Climate Change (IPCC), Socioeconomic Pathways and the International Energy Agency (IEA) World Energy Outlook scenarios.</td>
</tr>
<tr>
<td>Physical scenarios</td>
<td>Company-wide</td>
<td>Scenarios analysis allows us to better understand the impact of climate change and how it could affect our company. It is a critical tool for strategic and financial planning and risk management. In 2021, we continued to strengthen our methodology and tools to identify, assess and manage our climate risks and opportunities. Modeling simulations evaluated the potential directional impacts on Nestlé for both transition and physical risk factors. We partnered with Re storyline using methodology and scenarios from their academic partner, the Centre for Risk Studies at the University of Cambridge Judge Business School. We assess two types of risk: transition risk and physical risk. In 2020, we assessed our resilience over a five-year time horizon under different external conditions. In 2021, we extended the simulation from 2025 to 2040 for physical risk. The insights from this work further strengthen the importance and relevance of our climate-related actions outlined in our Net Zero Roadmap. Physical risks associated with a changing climate can be felt today. The Earth’s temperature has risen since the beginning of the industrial age (by around +1.1°C) and further warming is unavoidable. Over the next few decades scientists estimate that the global temperature will most likely increase by a minimum of 1.5°C by 2040. This is caused by the GHG emissions already in the air. To analyze the physical risk, we used this most likely scenario. The climate scenarios modelled included the IPCC’s RCP 4.5, an intermediate scenario more likely that not to result in a global temperature rise of between 2 and 3 degrees by 2100, and RCP 8.5, a very high baseline emissions scenario.</td>
</tr>

</table>

(C3.2b) Provide details of the focal questions your organization seeks to address by using climate-related scenario analysis, and summarize the results with respect to these questions.

Row 1

**Focal questions**

How might climate change plausibly affect the availability and quality of our raw materials? How might climate change impact our operational footprint including asset damage and related disruption to operational capabilities? How might the transition to a low carbon economy affect our business model and product categories?

**Results of the climate-related scenario analysis with respect to the focal questions**

We assessed macro-level physical risks for our key raw materials and our facilities until 2040. Projecting out to 2040, climate, heatwaves and drought/water stress-related risks are forecast to increase in frequency and severity. Availability and quality of raw materials: We mapped our sourcing locations and volumes and overlaid current and 2040-forecasted climate conditions to estimate the percentage change in expected yields. The main potential risks related to raw materials are increases in input costs and in price volatility, as well as their availability and quality. Raw materials availability and quality may be impacted through lower yields, yield variability and, in the longer term, a reduction in suitable areas for cultivation. Nestlé’s management of the mitigation of and adaptation to physical risks from climate change is aided by the sustainable sourcing actions our company has invested in for more than 20 years. Building on this, our Net Zero Roadmap, with its commitment to advance regenerative agriculture, aims to make farmers more resilient and produce in a more sustainable manner. Initiatives range from installing biogas digesters at dairy farms to growing 200 million trees by 2030 in sourcing landscapes. We also continue to distribute new coffee plantlets that perform better in locations affected by extreme weather events. The technical assistance we provide to farmers is evolving with the launch and gradual implementation of regenerative agriculture practices throughout our value chains. Actions underway in countries like the US, France and Germany include the phasing down of tillage, greater use of techniques like cover and intercropping, and switching to organic fertilizers. This improves resilience to extreme weather patterns and helps farmers reduce dependency on inputs from outside their sphere of control. Disruption to operational capabilities: We operate facilities all over the world and already face risks related to extreme weather events. The analysis provides us with further insight into the potential severity and frequency of extreme weather events and helps to strengthen our mitigation plans. We actively manage our risks related to extreme weather through site-specific loss prevention and business continuity strategies. The impact of extreme weather events on Nestlé’s facilities today is low. The physical risks highlighted could, however, lead to a small increase in the potential level of losses over and above what is experienced today, but overall our analysis does not identify any material financial impacts until 2040. Business model and product categories: Shifts in supply and demand as consumers prefer sustainable alternatives could lead to loss of revenue and/or missed growth opportunities, requiring a constant review of products and business models based on their environmental footprint.
(C3.3) Describe where and how climate-related risks and opportunities have influenced your strategy.

Have climate-related risks and opportunities influenced your strategy in this area?

<table>
<thead>
<tr>
<th>Products and services</th>
<th>Description of influence</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Dietary shifts – particularly toward plant-based diets – are one of the measures that society can take to help our food system within environmental limits. Trends show growing consumer demand for low-carbon products such as plant-based foods and drinks. Precisely, consumers demand increasingly transparent and sustainable products, as we have seen through market research like the Kantar ‘Who Cares Who Does’ 2020 report, and the ‘Nestlé Trend Early Identification &amp; Prioritization 2020’ report. Demand for products and services may be impacted as consumers switch to alternatives with less environmental footprint and innovative competitors emerge that challenge market share. If Nestlé does not anticipate and act on these changing consumer shifts, it has the potential to impact on Nestlé’s revenues and market shares. Description of how our strategy has been influenced by climate-related risks and/or opportunities: We approach this market dimension through our climate scenario analysis, considering the strategic uncertainty and future potential of sustainable alternatives, in terms of the proportion of consumers transitioning to products and services with less environmental footprint. Variable rates of adoption were projected across the different climate scenarios considered. We projected the increase in the percentage of consumers adopting sustainable alternative products across each climate scenario. Time horizon covered is medium-term: These inputs were benchmarked against historical product uptake rates. Products categories were allocated vulnerability assumptions dictating how exposed they may be to these trends. Revenue impacts were modelled in each year up to 2030. Rate of increase to 2030 value was non-linear. The model estimated potential directional financial impacts for each climate scenario considered. The most substantial decision we have made to date in this area is to align our core strategy with these consumer shifts which means engaging the one consumers a day who buy our products by offering more foods and beverages that are nutritious and have a lower carbon footprint. We aim to continually reduce the environmental footprint of our ingredients and recipes and investigate ways to transparently communicate about it. By engaging with consumers, we can increase demand for these products, which in turn will help us toward our Net Zero ambition.</td>
</tr>

<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The most substantial decision we have made to date in this area is to leverage forward-looking science to innovate and to help us understand the climate-related risks and opportunities for our business, from an R&amp;D perspective. This also helps us to address sustainability challenges such as reducing our GHG emissions in line with our climate ambition to achieve Net Zero GHG emissions by 2050. For example, in September 2020 we launched our Dairy accelerator in Konolfingen, Switzerland, which is designed to drive innovation and speed to market of sustainable dairy products and plant-based alternatives. Scientists understand that certain crops and commodities that we rely on will be limited or no longer available in the future, which is a risk to our business. However, it is also an opportunity, as our scientists are working to develop plant-based offerings from sustainable ingredients like peas, oats, rice, soy, coconut, and almonds, which are highly nutritious and have a lower carbon footprint. Covering the medium-term horizon to 2030, our scientists will work towards developing products with a lower carbon footprint from the onset, with qualitative climate-related results from life cycle assessments. All aspects of the value chain are considered for reductions in line with its increased focus on plant-based offerings. Description of how our strategy has been influenced by climate-related risks and/or opportunities: Concretely, as part of our Net Zero ambition, we will scale up initiatives in agriculture to help absorb more carbon, given this is an area of our value chain where most of our emissions occur. Nestlé will strengthen its programs with farmers to help restore land and limit GHG emissions. An example is the Skimmed Milk Zero Carbon Emissions Project: an ambition to switch to fully green milk by 2023. Nestlé will also step-up efforts to restore forests by replanting trees and enhancing biodiversity. An example of this is Nestlé’s commitment to plant 3 million trees in the next three years through Project RELeaf, in Malaysia. These initiatives are expected to help build resilient agricultural communities and supply chains.</td>

<td>Revenues</td>
<td>Revenues As part of our net-zero 2050 ambition, we are speeding up the transformation of our products in line with consumer trends and choices. Nestlé will launch more products that have a lower carbon footprint and contribute to a balanced diet. This includes more plant-based food and beverage options. Nestlé will also look to reformulate its products using more ingredients that are better for our health and the planet, for example, the use of renewable energy in production, different packaging and reduced emissions in the sourcing of raw ingredients.</td>
</tr>
<tr>
<td>Capital expenditures</td>
<td>Direct costs Nestlé is scaling up renewable energy sourcing (63.7% of all our electricity purchased came from renewable sources in 2021) in line with our Net Zero Roadmap. With our commitment, to transition to 100% renewable electricity by 2035, we will continue to increase the use of energy from renewable sources and collaborate with various partners to enable suppliers to invest in new infrastructure such as wind and solar farms. This is part of a broader trend of GES 3.2 billion by 2025 to put us on track of our Net Zero ambition. Acquisitions and investments are we also participating with the WEF in the Road Freight Zero initiative. Regarding our manufacturing, as disclosed in C2.3a, carbon pricing systems could result in increased operational costs for our company. In 2020, this led to our Board’s strategic decision to accelerate our transition to 100% renewable electricity purchased with a commitment to achieve 100% renewable electricity purchased in all our sites by 2025. The latter is the most substantial decision we have made to date in this area. In 2021, 63.7% of our total electricity purchased came from renewable sources in our manufacturing sites (compared with 50% in 2020). With regards to thermal energies, a dedicated internal working group has been created to evaluate and explore alternative low-carbon technologies and fuel sources between now and 2023. The time horizon it covers is short-term. This will allow the company to define more precisely its thermal renewable energy Roadmap and Advocacy strategy.</td>

Please explain target coverage and identify any exclusions
The emissions targets and progress in this disclosure, including this target, are based on the new 2018 baseline calculated under financial control, for the development of the Net Zero emissions roadmap published in 2020. New targets have been approved by SBTi at the end of 2020, following a 1.5C pathway. Previous CDP disclosures and other previous company disclosures have been made under operational control, as those reports were connected to previous targets (set in 2016) under such operational control.

Plan for achieving target, and progress made to the end of the reporting year
In 2020, we launched our Science Based Targets initiative (SBTi)-aligned Net Zero Roadmap, a science-based plan that expands on our climate ambitions. Thanks to this plan, we are putting peak carbon behind us and are working towards our emissions reduction targets for 2025 and 2030. All of our Scope 1 and 2 emissions are included in our Net Zero Roadmap, and our actions to address them are contributing to our absolute emissions reductions. In 2021, we increased the percentage of renewable electricity sourced to 63.7% (2020: 50.5%), in line with our commitment to source 100% renewable electricity across our sites globally by 2025. The increase was due to many sites in Argentina, Australia, Mexico, New Zealand and Russia achieving 100% renewable electricity. Through our Green Fleet Project, we are shifting to electric, biofuel, hybrid or plug-in hybrid vehicles. In 2021, our Green Fleet increased from 17.6% to 27.2% across our entire corporate fleet.

Target ambition
1.5°C aligned

Please explain target coverage and identify any exclusions
The emissions targets and progress in this disclosure, including this target, are based on the new 2018 baseline calculated under financial control, for the development of the Net Zero emissions roadmap published in 2020. New targets have been approved by SBTi at the end of 2020, following a 1.5°C pathway. With our targets approved at the end of 2020, we will continue to work towards achieving our reduction milestones (20% by 2025, 50% by 2030, Net Zero by 2050).

Plan for achieving target, and progress made to the end of the reporting year
In 2020, we launched our Science Based Targets initiative (SBTi)-aligned Net Zero Roadmap, a science-based plan that expands on our climate ambitions. Thanks to this plan, we are putting peak carbon behind us and are working towards our emissions reduction targets for 2025 and 2030. A detailed analysis of emissions against our 2018 baseline showed 95% of our greenhouse gas (GHG) emissions came from activities in our supply chain (such as farming and shipping) and just 5% from our own operations. Dairy and livestock ingredients are our largest single source of emissions – accounting for approximately half the emissions associated with producing our ingredients. We identified that to make progress toward our Net Zero ambition we must focus primarily on our upstream supply chain.

As a result of GHG reduction projects being scaled up in our operations and supply chain, we have put peak carbon behind us following two consecutive years of emissions reduction, while our business has grown. Most of our Scope 3 emissions reductions are the result of interventions in our livestock and dairy supply chains.

Is this a science-based target?
Yes, and this target has been approved by the Science Based Targets initiative

Target ambition
1.5°C aligned

Please explain target coverage and identify any exclusions
The emissions targets and progress in this disclosure, including this target, are based on the new 2018 baseline calculated under financial control, for the development of the Net Zero emissions roadmap published in 2020. New targets have been approved by SBTi at the end of 2020, following a 1.5C pathway. With our targets approved at the end of 2020, we will continue to work towards achieving our reduction milestones (20% by 2025, 50% by 2030, Net Zero by 2050).

Plan for achieving target, and progress made to the end of the reporting year
In 2020, we launched our Science Based Targets initiative (SBTi)-aligned Net Zero Roadmap, a science-based plan that expands on our climate ambitions. Thanks to this plan, we are putting peak carbon behind us and are working towards our emissions reduction targets for 2025 and 2030. A detailed analysis of emissions against our 2018 baseline showed 95% of our greenhouse gas (GHG) emissions came from activities in our supply chain (such as farming and shipping) and just 5% from our own operations. Dairy and livestock ingredients are our largest single source of emissions – accounting for approximately half the emissions associated with producing our ingredients. We identified that to make progress toward our Net Zero ambition we must focus primarily on our upstream supply chain. As a result of GHG reduction projects being scaled up in our operations and supply chain, we have put peak carbon behind us following two consecutive years of emissions reduction, while our business has grown. Most of our Scope 3 emissions reductions are the result of interventions in our livestock and dairy supply chains.

Is this target part of an emissions target?
This target is to support the achievement of targets to reduce scope 2 emissions.

Is this target part of an overarching initiative?
RE100

Please explain target coverage and identify any exclusions
Nestlé joined RE100 in 2014 and committed in December 2020 to procure 100% of electricity from renewable sources by 2025 in all its sites.

Plan for achieving target, and progress made to the end of the reporting year
In 2021, we increased the percentage of renewable electricity sourced to 60.7% (2020: 50%), in line with our commitment to source 100% renewable electricity across our sites globally by 2025. The increase was due to many sites in Argentina, Australia, Mexico, New Zealand and Russia achieving 100% renewable electricity.

Target year for achieving net zero
2050

Is this a science-based target?
Yes, we consider this a science-based target, and we have committed to seek validation of this target by the Science Based Targets initiative in the next 2 years

Please explain target coverage and identify any exclusions
We take a whole life cycle approach to determining the carbon footprint of our products. It is a process that involves working with many others, such as farmers, logistics providers and consumers. We need to act throughout our value chain towards our net zero ambition by 2050. Progress toward net zero will be measured against our 2018 GHG emissions. We calculated this baseline and defined our footprint in partnership with South Pole, an external consultant. They provide a clearly defined pathway for coupling future-proof growth with reductions in GHG emissions. As our Scope 3 emissions make up 95% of our footprint, we aim to address 80% of these. Our total reported Scope 3 emissions include some categories that are not currently covered by our Net Zero ambition. These include consumer use of sold products, and purchased services, leased assets, capital goods, and investments. As a result, our total reported Scope 3 emissions are higher than the actual emissions reported for 2021 against our net zero baseline. We plan to validate our commitment against the SBTi Net Zero standard published in 2021.

Do you intend to neutralize any unabated emissions with permanent carbon removals at the target year?
Yes

Planned milestones and/or near-term investments for neutralization at target year
In our Net Zero Roadmap, Nestlé sets out its ambition to be net zero by 2050 at the latest, as our company continues to grow, and with the following milestones: - By 2025, we aim to reduce our scope 1, 2 and 3 GHG emissions by 20% - By 2030, we aim to reduce our scope 1, 2 and 3 GHG emissions by 50% We have identified several emissions reduction and removal opportunities. Key levers include reducing emissions from dairy and livestock, portfolio management and packaging improvements. We're also investing in natural climate solutions such as our Global Reforestation Program (GRP), through which we aim to grow 200 million trees by 2030 in our sourcing landscapes. This is a key part of our Forest Positive strategy. Projects will include growing trees to help restore natural forest landscapes, introducing agroforestry systems for suitable crops such as cocoa and coffee, and supporting other natural ecosystem restoration activities. The projects are expected to have co-benefits, such as helping to improve soil health and water conservation, restoring degraded lands, contributing to biodiversity, mitigating climate change and supporting local livelihoods and the rights of Indigenous People and Local Communities. So that planted trees can survive and thrive, we follow a project cycle for every intervention, which includes country- and project-level assessments and stakeholder engagement for proper selection of the projects and the places where we implement them, as well as long-term monitoring of impact. For each project, verification or certification processes ensure that a robust set of carbon best practice principles are implemented and respected. We're also investing CHF 1.2 billion to help spark regenerative agriculture across our supply chain, as part of a total investment in emissions reductions and removals of CHF 3.2 billion by 2025.

Planned actions to mitigate emissions beyond your value chain (optional)

C4.3c

(C4.3c) What methods do you use to drive investment in emissions reduction activities?

<table>
<thead>
<tr>
<th>Method</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compliance with regulatory requirements/standards</td>
<td>Compliance is the foundation of how we do business and a non-negotiable requirement. In addition to complying with laws, regulations and internal requirements, Nestlé has a strong set of values and principles that we apply across all the countries where we operate. Our aim is for our investments to benefit both for our shareholders and the countries where we do business. The Nestlé Environmental Requirements are mandatory across our plants.</td>
</tr>
<tr>
<td>Employee engagement</td>
<td>In addition to Environmental Sustainability managers, there are energy management functional roles at different levels that also contribute to drive investment in emission reduction activities. Business Technical managers set market energy and emissions savings objectives for each Market in line with Corporate targets. The Market Chief Engineer defines the energy and emissions saving objectives for factories and supports them together with the Market Environmental Sustainability manager. The Industrial services engineer directly supports the factory. At a factory level, the factory engineer is in charge of and drives the energy conservation program that monitors utilities consumption and implements projects targeting energy use reduction and cost savings. The factory engineer is also in charge of establishing the factory specific Energy performance Indicators (EPIs) and monitor and analyses of EPIs together with the factory Environmental Sustainability manager and the line managers.</td>
</tr>
<tr>
<td>Lower return on investment (ROI) specification</td>
<td>Energy and other related sustainability projects are assessed separately using various parameters, such as energy savings in absolute GJ, absolute CO2 emission avoidance, absolute water savings and ROI.</td>
</tr>
<tr>
<td>Marginal abatement cost curve</td>
<td>All abatement projects assessed for our factories are benchmarked considering the marginal cost of energy reduction (GJ saved per CHF invested) which is used to prioritize the projects. Monetary reward and incentives are linked to attainment of energy savings, thus of GHG reduction targets.</td>
</tr>
<tr>
<td>Partnering with governments on technology development</td>
<td>We work with governments and technology development such as development of low grade temperature refrigerant and alternative energy producers.</td>
</tr>
<tr>
<td>Other (Setting strict targets and public commitments)</td>
<td>Nestlé has made public its ambition to reach Net Carbon Zero by 2050 across the extended supply chain (scope 1/2/3) and to reach -20% in 2025 (vs the 2018 GHG baseline) and -50% in 2030. A dedicated ESG Strategy &amp; Deployment unit has been created at Head Office to deploy our ESG actions through the markets. Various initiatives are being deployed, such as conversion to renewable electricity and low-emission vehicle fleet, use of biofuels, developing biodegradable and compostable packaging, product reformulation, tree planting, investing in targeted R&amp;D, etc. We are ramping up our capital investments in this area over the next five years.</td>

<th>Other, please specify (Carbon neutral brands)</th>
</tr>
</thead>
</table>

**Description of product(s) or service(s)**
In addition to the carbon reductions and removals planned across our value chain towards our Net Zero ambition, in the short-to-medium term some brands are investing in carbon credits to compensate for GHG emissions relating to their products. Our Brands Climate Hub, established in 2021, ensures that GHG reduction roadmaps and carbon-credit sourcing follow Nestlé guidelines, in compliance with high-quality industry standards. The Hub first conducts a baseline study, which includes a Life Cycle Assessment (LCA) that draws a clear picture of all GHG emissions associated with the brand, from sourcing its ingredients through production, distribution and consumption. Each brand performing an LCA uses the same methodology and an independent reviewer checks alignment with our guidelines. The Hub then creates a roadmap for the brand to reduce and remove carbon emissions inside its value chain. To address the remaining emissions, brands can source high-quality carbon offsets by investing in specific projects around the world. Projects often have co-benefits such as helping to improve air quality, increase biodiversity and improve farmer livelihoods. An external third party certifies a brand to be carbon neutral, meaning the brand has met recognized international standards. Finally, a third-party annual assessment gauges GHG emissions at any given time as brands implement changes. Nestlé brands that were certified carbon neutral in 2021 include Garden of Life and Wunda.

**Have you estimated the avoided emissions of this low-carbon product(s) or service(s)?**

(C5.1a) Has your organization undergone any structural changes in the reporting year, or are any previous structural changes being accounted for in this disclosure of emissions data?

Row 1

Has there been a structural change?
Yes, an acquisition
Yes, a divestment

Name of organization(s) acquired, divested from, or merged with
In 2021, we completed the following: – Divestment of our Nestlé Waters North America brands. – Acquisition of the core brands of The Bountiful Company, including Nature’s Bounty, Solgar, Osteo Bi-Flex, Puritan’s Pride, Ester-C and Sundown. – Acquisition of Essentia, a premium functional water brand. – Acquisition of Nuun, a leader in functional hydration through effervescent tablets.

Details of structural change(s), including completion dates
Nestlé completed acquisitions and divestments with a total value of around CHF 9.9 billion in 2021.

Comment

(C6.4) Are there any sources (e.g., facilities, specific GHGs, activities, geographies, etc.) of Scope 1 and Scope 2 emissions that are within your selected reporting boundary which are not included in your disclosure?

Yes

(C6.4a)
C6.4a Provide details of the sources of Scope 1 and Scope 2 emissions that are within your selected reporting boundary which are not included in your disclosure.

<table>
<thead>
<tr>
<th>Source</th>
<th>Distribution centers &amp; transportation</th>
</tr>
</thead>
</table>

**Relevance of Scope 1 emissions from this source**
- Emissions are not relevant

**Relevance of location-based Scope 2 emissions from this source**
- Emissions are not relevant

**Relevance of market-based Scope 2 emissions from this source (if applicable)**
- Emissions are not relevant

**Explain why this source is excluded**
All data related to transportation and distribution activities are tracked in a separate system from data related to manufacturing. The majority of our transportation and distribution activities are outsourced (~90%). For practical reasons, emissions occurring from Nestlé’s own transportation and distribution activities (i.e. not outsourced, which are a minority) are calculated and aggregated together with the outsourced activities as a whole and are therefore included in our scope 3 emissions disclosure.

**Estimated percentage of total Scope 1+2 emissions this excluded source represents**
5%

**Explain how you estimated the percentage of emissions this excluded source represents**
Estimated based on the GHG emissions associated with distribution activities that are not outsourced, as these are reported under downstream distribution in scope 3.

C6.5

(C6.5) Account for your organization’s gross global Scope 3 emissions, disclosing and explaining any exclusions.

**Purchased goods and services**

**Evaluation status**
- Relevant, calculated

**Emissions in reporting year (metric tons CO2e)**
- 85919520

**Emissions calculation methodology**
- Hybrid method

**Percentage of emissions calculated using data obtained from suppliers or value chain partners**
- 11.3%

**Please explain**
For purchased goods, the amount of materials purchased reported through our global data systems (SAP) is multiplied by the emission factor corresponding to a representative dataset. Corrections were made to purchased volumes to be representative of fresh equivalent volumes at farm to match the scope of the emissions factors being applied. Where relevant, emission factors for manufacturing of ingredients and conversion of packaging materials were also considered. The results are aggregated to obtain the GHG emissions associated to the respective categories, sub-categories, markets and plants. The sources of emission factors are: World Food LCA Database (v.3.6), ecoinvent v.3.7, BEIS, Agribalyse, Agrifootprint, Geofootprint and Nestlé internal LCA databases. For selected raw ingredients, the input data was disaggregated so as to consider best practices or regions. In all cases, the results are calculated using the IPCC characterization factors. Primary emissions factors from Cool Farm Tool (CFT) assessments were used for all raw milk sourcing. For packaging, the Circular Footprint Formula (CFF) developed by the European Commission was applied to our packaging volumes of virgin and recycled materials. For services, Input/Output modelling was used, whereby the expenditure in CHF was linked to the respective GHG emissions of the types of services purchased. A contribution analysis was performed to identify the largest contributors to the overall results.

**Capital goods**

**Evaluation status**
- Relevant, calculated

**Emissions in reporting year (metric tons CO2e)**
- 5409219

**Emissions calculation methodology**
- Spend-based method

**Percentage of emissions calculated using data obtained from suppliers or value chain partners**
- 0%

**Please explain**
Input/Output modelling was used, whereby the expenditure in CHF by spend type was linked to the respective GHG emissions of the types of fixed assets and consumables purchased. In all cases, the results are calculated using the IPCC 2013 GWP 100 characterization factors. A contribution analysis was performed to identify the largest contributors to the overall results.
Fuel-and-energy-related activities (not included in Scope 1 or 2)

Evaluation status
Relevant, calculated

Emissions in reporting year (metric tons CO2e)
865023

Emissions calculation methodology
Fuel-based method

Percentage of emissions calculated using data obtained from suppliers or value chain partners
0

Please explain
Emission factors were sourced from IEA (for calculating well-to-tank (WTT) emissions of purchased electricity) and DEFRA/BEIS (to calculate WTT emissions of the consumed fuels). Electricity consumption related emissions factors incorporate emissions associated with WTT activities and transmission and distribution losses. Emissions were calculated for each plant and each energy source by multiplying the energy content of the different fuels (and electricity) with the associated emission factors. In all cases, the results are calculated using the IPCC 2013 GWP 100 characterization factors.

Upstream transportation and distribution

Evaluation status
Relevant, calculated

Emissions in reporting year (metric tons CO2e)
2758785

Emissions calculation methodology
Distance-based method

Percentage of emissions calculated using data obtained from suppliers or value chain partners
0

Please explain
A Python open-source query package was used to look up the grid coordinates and subsequently the distance between the vendor site location and the Nestlé plant location where purchased materials were delivered. Multiplying the mass of goods transported by the distance provides a good estimate of the total tonne-kilometre (t.km) travelled by the goods. Supply Chain experts within Nestlé provided a breakdown of the modes of transports used for inbound logistics by region. Through these splits by vehicle type appropriate emissions factors from DEFRA/BEIS were applied to the activity data based on vehicle type. In all cases, the results are calculated using the IPCC 2013 GWP 100 characterization factors.

Waste generated in operations

Evaluation status
Relevant, calculated

Emissions in reporting year (metric tons CO2e)
35092

Emissions calculation methodology
Waste-type-specific method

Percentage of emissions calculated using data obtained from suppliers or value chain partners
0

Please explain
Waste volumes for all manufacturing sites and a high proportion of distribution centers is collated centrally including details of waste material and destination. Emission factors sourced from DEFRA/BEIS and are specific to waste categories and treatment methods. Emissions were calculated by multiplying the volume of the waste by destination, with the relevant emission factor. In all cases, the results are calculated using the IPCC 2013 GWP 100 characterization factors.

Business travel

Evaluation status
Relevant, calculated

Emissions in reporting year (metric tons CO2e)
35715

Emissions calculation methodology
Distance-based method

Percentage of emissions calculated using data obtained from suppliers or value chain partners
0

Please explain
All the data for air travel was provided by our global travel agent which tracks all business-related flights booked by Nestlé employees. Kilometers of business air travel were apportioned according to flight class (Economy, Premium, Business, First) and haul (short, medium, long). Emission factors for business travel were sourced from DEFRA/BEIS data. The GHG emissions reported by our travel agent include the additional impact from radiative forcing (RF). For ground travel, data was also provided by our hire car partners on rentals, distance travelled and GHG emissions considering the vehicle type. In all cases, the results are calculated using the IPCC 2013 GWP 100 characterization factors.
Employee commuting

Evaluation status
Relevant, calculated

Emissions in reporting year (metric tons CO2e)
469805

Emissions calculation methodology
Distance-based method

Percentage of emissions calculated using data obtained from suppliers or value chain partners
0

Please explain
Employee commuting emissions were based upon Nestlé's global employee headcount. Assumptions about the average distance travelled and proportions of transport modes were made based upon regional commuter data across the US, Europe, and Asia. For the US and Europe, transport mode proportions were based upon government data. Asia's transportation modes were based on generic global data. The GHG emissions for employee commuting and in total were calculated using ecoinvent (v.3.5) emission factors based on IPCC 2013 100-year data.

Upstream leased assets

Evaluation status
Relevant, calculated

Emissions in reporting year (metric tons CO2e)
21604

Emissions calculation methodology
Fuel-based method

Percentage of emissions calculated using data obtained from suppliers or value chain partners
0

Please explain
This category included assets leased by Nestlé but not owned by Nestlé (acting as the lessee). Emission factors in kgCO2e/kWh were sourced from IEA to calculate emissions from the use of purchased electricity, including well-to-tank (WTT) activities, and transmission and distribution losses. Data in square meters by building type (e.g. retail stores, distribution centers, other) was extracted from Nestlé’s Real Estate database. The extracted data included details regarding location, type of occupier, and total period over which Nestlé had control of the real estate during the reporting year. This information was used to calculate electricity consumption per type of building, based on EU energy statistics (office and retail), US EIA (distribution centers) and average consumption per region (other). In all cases, the results are calculated using the IPCC 2013 GWP 100 characterization factors.

Downstream transportation and distribution

Evaluation status
Relevant, calculated

Emissions in reporting year (metric tons CO2e)
5854015

Emissions calculation methodology
Distance-based method

Percentage of emissions calculated using data obtained from suppliers or value chain partners
0

Please explain
Nestlé uses the Ecotransit emissions calculation tool. Ecotransit uses fuel consumption to calculate emissions. It requires the source, destination, weight and mode of transport, which is available in our systems. Based on this information, Ecotransit calculates the distance for a specific mode/vehicle type to calculate final emissions. It uses country defaults (most commonly used) such as engine type (e.g. Euro 1-6) and bio-fuel share, among others, to fill any missing information required to calculate emissions. Ecotransit considers metropolitan areas or highways in the route as parameter to determine vehicle fuel consumption.

Processing of sold products

Evaluation status
Not relevant, explanation provided

Emissions in reporting year (metric tons CO2e)
<Not Applicable>

Emissions calculation methodology
<Not Applicable>

Percentage of emissions calculated using data obtained from suppliers or value chain partners
<Not Applicable>

Please explain
This category is not relevant for Nestlé, as the company sells finished food products. Most of our products are sold for direct consumption, which therefore does not involve further industrial processing.
Use of sold products

Evaluation status
Relevant, calculated

Emissions in reporting year (metric tons CO2e)
10773148

Emissions calculation methodology
Methodology for direct use phase emissions, please specify (Direct use phase emissions include electrical appliances sold by Nestlé such as personal coffee machines and water coolers and consider the entire useful life of these appliances sold in the reporting year.)
Methodology for indirect use phase emissions, please specify (Indirect use phase emissions included all product types that require energy in their preparation and the preparation assumptions were based on the product specific instructions and grid emission factors from the International Energy Agency (2020).)

Percentage of emissions calculated using data obtained from suppliers or value chain partners
0

Please explain
Reported values include both Direct and Indirect use phase GHG emissions. Direct use phase emissions include electrical appliances sold by Nestlé such as personal coffee machines and water coolers and consider the entire useful life of these appliances sold in the reporting year. Indirect use phase emissions included all product types that require energy in their preparation and the preparation assumptions were based on the product specific instructions and grid emission factors from the International Energy Agency (2020). In addition, a literature review was conducted to collect data on average electricity consumption of household appliances. For each product, the total electricity consumption was estimated in Kilowatt hour (Kwh), based on product use assumptions, as provided by Nestlé, and appropriate household appliance electricity consumption rates, as identified through the literature review. Subsequently, the country-specific grid emissions factor was multiplied with the total electricity consumption to calculate total emissions. In all cases, the results are calculated using the IPCC 2013 GWP 100 characterization factors.

End of life treatment of sold products

Evaluation status
Relevant, calculated

Emissions in reporting year (metric tons CO2e)
1491416

Emissions calculation methodology
Waste-type-specific method

Percentage of emissions calculated using data obtained from suppliers or value chain partners
0

Please explain
Here we have captured GHG emissions from end-of-life treatment both from the packaging of our products and the food waste at point of consumption. For packaging, the Circular Footprint Formula (CFF) developed by the European Commission was applied to our packaging volumes. Inputs to this formula include market specific recycling rates for key materials along with assumptions on incineration and open burning rates based on the development status of the markets infrastructure based on a literature review. Appropriate emissions factors by end-of-life destination, by material were sourced from ecoinvent v.3.7. Regionally specific emissions factor values were included where available otherwise global average values were used. For food waste, a volume of food waste was modelled for each product category based on the volume of product sold and a percentage of waste occurring both in storage and in consumption. Depending on the product type (whether it was solid or liquid), the carbon footprint of food waste was modelled by applying an emissions factor for either composting of biowaste or wastewater treatment. Assumptions were also included for distance travelled from consumer home to waste treatment sites. In all cases, the results are calculated using the IPCC 2013 GWP 100 characterization factors.

C-AC6.8/C-FB6.8/C-PF6.8

(C-AC6.8/C-FB6.8/C-PF6.8) Is biogenic carbon pertaining to your direct operations relevant to your current CDP climate change disclosure?

Yes

C-AC6.8a/C-FB6.8a/C-PF6.8a

(C-AC6.8a/C-FB6.8a/C-PF6.8a) Account for biogenic carbon data pertaining to your direct operations and identify any exclusions.

CO2 emissions from biofuel combustion (processing/manufacturing machinery)

Emissions (metric tons CO2)
47649

Methodology
Default emissions factors

Please explain
This includes biomass sustainably sourced and combusted in our manufacturing sites for the generation of heat (mostly wood and spent coffee grounds).

C-AC6.9/C-FB6.9/C-PF6.9
Agricultural commodities
Other (Coffee)
Do you collect or calculate GHG emissions for this commodity?
Yes
Please explain
Nestlé tracks our coffee procurement volumes by supplier, by origin and by certification status (e.g. 4C/AAA/RA). Through our network of agricultural support staff we have started integrating additional primary data from agricultural production to generate more representative emissions factors by farm archetype and origin. Where primary data was not available for 2021, we have used country specific emission factors for coffee production from World Food LCA Database (v.3.6).

Agricultural commodities
Other (Wheat)
Do you collect or calculate GHG emissions for this commodity?
Yes
Please explain
Nestlé tracks our wheat procurement volumes by supplier, by origin. We have used country specific emission factors for wheat production from World Food LCA Database (v.3.6). Where country specific values are not available we have used regional averages.

Agricultural commodities
Cattle products
Do you collect or calculate GHG emissions for this commodity?
Yes
Please explain
Dairy is our single biggest category, both by volume and contribution to our GHG footprint. We source it from both small-scale and large-scale producers all around the world. The volumes of dairy milk purchased globally are accurately tracked both at market and group level. Nestlé has rolled out Cool Farm Tool (CFT) assessments across our raw milk sourcing regions, by farm archetype to provide primary emissions factors for our GHG accounting. We are actively engaging with our dairy derivative suppliers to increase the quantity and quality of supply chain specific data being shared each year. Beef is a very minor ingredient for us in terms of volume. We calculate the footprint of our beef purchasing using representative emissions factors from World Food LCA Database (v.3.6).

C-AC6.9a/C-FB6.9a/C-PF6.9a
(C-AC6.9a/C-FB6.9a/C-PF6.9a) Do you collect or calculate greenhouse gas emissions for each commodity reported as significant to your business in C-AC0.7/FB0.7/PF0.7?

C6.10
CDP
(C6.10) Describe your gross global combined Scope 1 and 2 emissions for the reporting year in metric tons CO$_2$e per unit currency total revenue and provide any additional intensity metrics that are appropriate to your business operations.

Intensity figure
57.21

Metric numerator (Gross global combined Scope 1 and 2 emissions, metric tons CO$_2$e)
4982000

Metric denominator
unit total revenue

Metric denominator: Unit total
87088

(C8.2c) State how much fuel in MWh your organization has consumed (excluding feedstocks) by fuel type.

**Sustainable biomass**

**Heating value**

LHV

**Total fuel MWh consumed by the organization**

1865909

**MWh fuel consumed for self-generation of electricity**

76710

**MWh fuel consumed for self-generation of heat**

559773

**MWh fuel consumed for self-generation of steam**

1229427

**MWh fuel consumed for self-generation of cooling**

<Not Applicable>

**MWh fuel consumed for self- cogeneration or self-trigeneration**

<Not Applicable>

**Comment**

For the purposes of this CDP response, solid biomass is considered sustainable if it complies with CDP guidance and/or with the Nestlé Responsible Sourcing Standard – Addendum on biomass. For gaseous and liquid biofuels and some solid biomass, as the feedstock is managed by the energy supplier and as the CDP guidance was recently issued, we have not had time to confirm whether this qualifies as sustainable. These categories have been reported under “other biomass”. The total fuel is measured, but the split between use for electricity, heat and steam is estimated. Values are for owned manufacturing sites only.

C8.2h

(C8.2h) Provide details of your organization’s renewable electricity purchases in the reporting year by country

Country/area of renewable electricity consumption
Argentina

Sourcing method
Direct procurement from an offsite grid-connected generator e.g. Power Purchase Agreement (PPA)

Renewable electricity technology type
Wind

Renewable electricity consumed via selected sourcing method in the reporting year (MWh)
54702

Tracking instrument used
Contract

Total attribute instruments retained for consumption by your organization (MWh)
54702

Country/area of origin (generation) of the renewable electricity/attribute consumed
Argentina

Commissioning year of the energy generation facility (e.g. date of first commercial operation or repowering)
2018

Vintage of the renewable energy/attribute (i.e. year of generation)
2021

Brand, label, or certification of the renewable electricity purchase
Other, please specify (YPF)

Comment
Contract and invoicing directly from the generation facility.

Country/area of renewable electricity consumption
Argentina

Sourcing method
Unbundled Energy Attribute Certificate (EAC) purchase

Renewable electricity technology type
Hydropower (capacity unknown)

Renewable electricity consumed via selected sourcing method in the reporting year (MWh)
13731

Tracking instrument used
I-REC

Total attribute instruments retained for consumption by your organization (MWh)
13731

Country/area of origin (generation) of the renewable electricity/attribute consumed
Argentina
Commissioning year of the energy generation facility (e.g. date of first commercial operation or repowering) 2018
Vintage of the renewable energy/attribute (i.e. year of generation) 2021
Brand, label, or certification of the renewable electricity purchase No brand, label, or certification
Comment 10,609 from PPA (2 wind farms). Remainder is mandatory purchase of renewable certificates.

Australia
Country/area of renewable electricity consumption
Sourcing method Direct procurement from an offsite grid-connected generator e.g. Power Purchase Agreement (PPA)
Renewable electricity technology type Wind
Renewable electricity consumed via selected sourcing method in the reporting year (MWh) 25780
Tracking instrument used Australian LGC
Total attribute instruments retained for consumption by your organization (MWh) 25780
Country/area of origin (generation) of the renewable electricity/attribute consumed Australia
Commissioning year of the energy generation facility (e.g. date of first commercial operation or repowering) 2018
Vintage of the renewable energy/attribute (i.e. year of generation) 2021
Brand, label, or certification of the renewable electricity purchase No brand, label, or certification
Comment 10,609 from PPA (2 wind farms). Remainder is mandatory purchase of renewable certificates.

Belgium
Country/area of renewable electricity consumption
Sourcing method Green electricity products from an energy supplier (e.g. Green Tariffs)
Renewable electricity technology type Hydropower (capacity unknown)
Renewable electricity consumed via selected sourcing method in the reporting year (MWh) 7778
Tracking instrument used GO
Total attribute instruments retained for consumption by your organization (MWh) 7778
Country/area of origin (generation) of the renewable electricity/attribute consumed Please select
Commissioning year of the energy generation facility (e.g. date of first commercial operation or repowering)
Vintage of the renewable energy/attribute (i.e. year of generation) 2021
Brand, label, or certification of the renewable electricity purchase No brand, label, or certification
Comment European Hydro GoO

Brazil
Country/area of renewable electricity consumption
Sourcing method Direct procurement from an offsite grid-connected generator e.g. Power Purchase Agreement (PPA)
Renewable electricity technology type Hydropower (capacity unknown)
Renewable electricity consumed via selected sourcing method in the reporting year (MWh) 384856

C8.2k

(C8.2k) Describe how your organization’s renewable electricity sourcing strategy directly or indirectly contributes to bringing new capacity into the grid in the countries/areas in which you operate.

We consider and are open to using all renewable electricity options accepted by RE100, keeping unbundled EAC as the least preferred option. Our preference is for off-site generation as the larger scale can benefit both Nestlé and society.

C8.2l

(C8.2l) In the reporting year, has your organization faced any challenges to sourcing renewable electricity?

<table>
<thead>
<tr>
<th>Challenges to sourcing renewable electricity</th>

C11. Carbon pricing

(C11.1) Are any of your operations or activities regulated by a carbon pricing system (i.e. ETS, Cap & Trade or Carbon Tax)?
Yes

(C11.1a) Select the carbon pricing regulation(s) which impacts your operations.
EU ETS

(C11.1b) Complete the following table for each of the emissions trading schemes you are regulated by.

<table>
<thead>
<tr>
<th>EU ETS</th>
<th>% of Scope 1 emissions covered by the ETS</th>
<th>% of Scope 2 emissions covered by the ETS</th>
<th>Period start date</th>
<th>Period end date</th>
<th>Allowances allocated</th>
<th>Allowances purchased</th>
<th>Verified Scope 1 emissions in metric tons CO2e</th>
<th>Verified Scope 2 emissions in metric tons CO2e</th>
<th>Details of ownership</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>EU ETS</td>
<td>4.8</td>
<td>0</td>
<td>January 1 2021</td>
<td>December 31 2021</td>
<td>20197</td>
<td>70613</td>
<td>220132</td>
<td>0</td>
<td>Facilities we own and operate</td>
<td></td>
</tr>
</tbody>
</table>

(C11.1d) What is your strategy for complying with the systems you are regulated by or anticipate being regulated by?

Our strategy for complying with the EU-ETS includes improving energy efficiency and switching to cleaner fuels (from gas to lower carbon fuels, for example). For example, in 2021 several different energy efficiencies projects have been implemented, such as heat recovery air heaters in our Nescafé factory in Girona, Spain, and heat recovery technology at our Purina factory in Aubigny, France. Nestlé’s EU-ETS strategy is to remain compliant considering the following action plan: 1. Maximize energy efficiency at existing installations, 2. Redesign processes to use less energy or low-carbon energy, and 3. Transition to renewable energy sources. Facilities which might face a credit deficit submit an action plan to fulfil their EU-ETS allowances. The evolution of CO2 emissions and progress on the corresponding action plans set by facilities are analyzed on an annual basis at Market level. In cases when those measures may not provide the reductions necessary to comply with regulations, we are required to purchase EU-ETS carbon allowances.
### C11.2a

(C11.2a) Provide details of the project-based carbon credits originated or purchased by your organization in the reporting period.

C11.3

(C11.3) Does your organization use an internal price on carbon?
No, and we do not currently anticipate doing so in the next two years

C12. Engagement

C12.1

(C12.1) Do you engage with your value chain on climate-related issues?
Yes, our suppliers
Yes, our customers/clients
Yes, other partners in the value chain

C12.1a
(C12.1a) Provide details of your climate-related supplier engagement strategy.

**Type of engagement**
Engagement & incentivization (changing supplier behavior)

**Details of engagement**
Run an engagement campaign to educate suppliers about climate change

- **% of suppliers by number**
  45

- **% total procurement spend (direct and indirect)**
  80

- **% of supplier-related Scope 3 emissions as reported in C6.5**
  72

**Rationale for the coverage of your engagement**
Our rationale for coverage is to focus on the categories with the largest GHG footprint namely: Dairy, Coffee, Cocoa, and Vegetable Oils, which account for approximately 15% of our total procurement spend. A detailed analysis of emissions against our 2018 baseline showed 95% of our greenhouse gas (GHG) emissions came from activities in our supply chain (such as farming and shipping) and just 5% from our own operations. We identified that to make progress toward our Net Zero ambition we must focus primarily on our upstream supply chain, particularly suppliers of dairy and livestock ingredients but also other agricultural raw materials. We know that regenerative agriculture plays a critical role in improving soil health, restoring water cycles and increasing biodiversity for the long term. These outcomes form the foundation of sustainable food production and we expect that contribute to our Net Zero ambition.

**Impact of engagement, including measures of success**
In 2021, we spent time helping core suppliers become more aware of the threat of climate change and adopt more regenerative agriculture practices. The process for suppliers is not easy. They have to ensure that their supply chains and farmers are making changes. The first step toward this is fully understanding the changes required. We published a major FAQ document and held webinars to answer questions, with hundreds of vendors participating. Overall, we plan to invest CHF 3.2 billion by 2025 to address climate change, and CHF 1.2 billion of that is targeted at sparking more regenerative agriculture practices across our supply chain. With 115 projects co-financed by Nestlé and vendors, we expect that by 2030, half of our key agricultural raw materials will come from regenerative sources. We’ve spent a lot of time building internal expertise on climate – training our buyers and category team members and creating awareness – so we can engage with vendors on these topics. Now the focus is on educating and training suppliers and ramping up initiatives. It’s all part of our determination to get regenerative agriculture moving in the right direction.

Comment

---

(C12.1b) Give details of your climate-related engagement strategy with your customers.

**Type of engagement & Details of engagement**

| Education/Information sharing | Share information about your products and relevant certification schemes (i.e. Energy STAR) |

- **% of customers by number**

- **% of customer-related Scope 3 emissions as reported in C6.5**

**Please explain the rationale for selecting this group of customers and scope of engagement**
Our rationale for coverage is based on Nestle's response to customer requests for information on climate change and other sustainability impacts through CDP, EcoVadis and other questionnaires. For example, we are responding to customer requests relating to our scope 3 emissions through this CDP questionnaire. In addition, in 2021 multiple large customers in Europe, the United States and Australia requested that Nestlé participate in the EcoVadis supplier sustainability rating platform, to demonstrate our eligibility to take part in tender processes. This is particularly relevant for our Nestlé Professional business, which provides food and drink to a range of businesses including restaurants, hotels and workplaces. We engage with Walmart to provide our input to the Sustainability Category Profile and take part in its Supplier Sustainability Index and Project Gigaton initiatives.

**Impact of engagement, including measures of success**
In 2021, we continued to engage with customers requesting information on GHG through the CDP supplier program, representing a total of 15 customers, including some major retailers in important markets. We estimate that our ability to share a positive EcoVadis rating enables sales contracts of at least CHF 200 million annually.

---

(C12.1d)
(C12.1d) Give details of your climate-related engagement strategy with other partners in the value chain.

Consumers

Methods of Engagement: We help consumers make informed choices through credible, substantiated communication. We use relevant contact points including digital resources, packaging and point-of-sale displays to inform consumers of action they can take when choosing and using our products and through the correct disposal of packaging. We have strong processes in place on the use of legitimate claims and wording to ensure credible consumer communications. We support and shape the development of environmental communication best practices – including standardization around claims - working in collaboration with industry, government and public forums. In 2021, Nestlé launched its carbon neutral brand Wunda, including on-pack and digital communications around climate change.

Measures of success: In addition to the carbon reductions and removals in our value chain, in the short-to-medium term some of our brands are investing in carbon credits to compensate for emissions relating to their products. We purchase high-quality carbon credits that help fund natural climate solutions and other activities outside our value chain, including tree planting, forest protection and, in some cases, social programs for rural communities. Brands can communicate the resulting carbon neutral status to consumers – as long as they can prove the GHG reduction and commit to significantly and progressively reducing their GHG emissions in line with the Net Zero Roadmap.

Other stakeholders

Methods of Engagement: Our global stakeholder network includes local communities, suppliers, consumers, non-governmental organizations, civil society organizations, academia, multilateral organizations, governments, customers, our employees and shareholders. We are in dialogue regularly with these stakeholders through various platforms, forums and meetings to help advance our Creating Shared Value strategy and support our intention to advance regenerative food systems at scale. In 2021, we:

- Ran a series of Food Systems Summit dialogues with key stakeholders to provide input into the UN Food Systems Summit of September 2021, where Nestlé engaged in several ways.
- Hosted an online stakeholder dialogue to launch our new plan to advance regenerative food systems at scale. For Nestlé, this marked the beginning of ongoing stakeholder engagement on how to work toward this goal and the challenges involved.
- Organized a series of virtual roundtable events to gain external perspectives from sustainability experts on our Garden Gourmet range of plant-based foods and our Wunda plant-based drinks range.
- Revised the Sustainability section of our website to make information on our actions regarding climate change and other sustainability topics more accessible.

Measures of success: Success is measured by the quality of discussions we have with stakeholders at a global level and the outcomes of perception surveys carried out in with partners such as Globescan. In 2021, Globescan results showed that stakeholder expectations on climate change have intensified, along with the connected challenges of biodiversity and regenerative agriculture. There is also a sense of ‘announcement-fatigue’, with stakeholders asking for detail about action and impact. Climate and decarbonisation was spontaneously mentioned by stakeholders most often as the sustainability issue that Nestlé needs to address. Our markets, zones and some individual businesses also carry out regular stakeholder engagement activities.

C12.2

(C12.2) Do your suppliers have to meet climate-related requirements as part of your organization’s purchasing process?
Yes, climate-related requirements are included in our supplier contracts

C12.2a

(C12.2a) Provide details of the climate-related requirements that suppliers have to meet as part of your organization’s purchasing process and the compliance mechanisms in place.

Management practice
Agroforestry

Description of management practice
Our Global Reforestation Program (GRP) aims to grow 200 million trees by 2030 in our sourcing landscapes. This is a key part of our Forest Positive strategy. By helping to conserve and restore natural ecosystems in our production regions and improve agricultural production, we aim to create a positive impact on people, nature and climate. Our projects will include growing trees to help restore natural forest landscapes, introducing agroforestry systems for suitable crops such as cocoa and coffee, and supporting other natural ecosystem restoration activities. The projects are expected to have co-benefits, including helping to improve soil health and water conservation, restoring degraded lands, contributing to biodiversity, mitigating climate change and supporting local livelihoods and the rights of Indigenous People and Local Communities. So that planted trees can survive and thrive, we follow a project cycle for every intervention, which includes country- and project-level assessments and stakeholder engagement for proper selection of the projects and the places where we implement them, as well as long-term monitoring of impact. For each project, verification or certification processes ensure that a robust set of carbon best practice principles are implemented and respected.

Your role in the implementation
Financial
Knowledge sharing
Operational
Procurement

Explanation of how you encourage implementation
For our initial projects, we have partnered with global tree-planting experts such as One Tree Planted and PUR Projet, as well as carbon accounting initiatives Biodiverse Carbon and South Pole. Together, we have set the foundations for a long-term, credible and robust program. One example is a project recently launched in the Philippines, where we have secured 2.5 million bamboo clumps and one million native trees in one of our coffee-sourcing regions. Bamboo thrives in degraded lands and sequesters carbon quickly. It also provides livelihood opportunities by harvesting the top of the plant to make paper, wood or textile products. In 2021, we also started a reforestation project in Nicaragua, where we have secured 7.5 million trees for planting. To date, our projects have secured a total of 24.6 million trees for planting in regions we source from, contributing toward our overall reforestation goal with 9.3 million tonnes of CO2e removals initiated over project lifetimes.

Climate change related benefit

Management practice
Permanent soil cover (including cover crops)

Description of management practice
Nestlé is involved with the Earthworm Foundation’s Living Soils Initiative (Projet Sols Vivant) works with 30 farmers producing potatoes, sugar beet, wheat and vegetables in the north of France, providing technical support and financial tools to help the farmers improve soil health and, in doing so, hold more carbon in the soil. Retaining carbon not only prevents carbon dioxide from being released into the atmosphere, where it can contribute to climate change, but also enhances water retention and helps release nutrients for plant growth, increasing crop yields.

Your role in the implementation
Financial
Knowledge sharing
Operational
Procurement

Explanation of how you encourage implementation
Several local partners have been contracted to provide focused trainings and coaching to farmers who are part of the initiative. In addition, farmers who are part of the “preference” sustainability scheme (a related program to implement sustainable practices) receive a price premium to reward the implementation of a set of selected practices.

Climate change related benefit
Emissions reductions (mitigation)
Increasing resilience to climate change (adaptation)
Increase carbon sink (mitigation)
Reduced demand for fertilizers (adaptation)

Management practice
Knowledge sharing

**Description of management practice**

Our approach is to support producers for Nespresso to better manage their farms, their businesses and their land, aiming to a greater resilience of the coffee farms and communities. We promote regenerative agriculture via the deployment of practices aligned with Rainforest Alliance principles (no deforestation and conservation practices), agroforestry farming models and low carbon practices. We operationalize agroforestry as our nature based solution aimed at adaptation to climate change (extreme weather patterns, soil degradation, water accessibility) and biodiversity loss. Various models of agroforestry are deployed enabling to generate defined ecosystems services from water and soil retention, pollination, income diversification and carbon sequestration. For smallholders, and particularly in Africa, the curriculum contains specific training on how to prepare compost and how to mulch. We initiated a landscape approach in Brazil Cerrado which is now managed by an autonomous organization, Cerrado das Aguas. The five-year commitment of private and public sector (2019-2023) has enabled to fund a conscious producer program promoting best practices on farm as well as restoration of degraded land.

**Your role in the implementation**

Financial

Operational
Procurement

Other, please specify (Monitoring and evaluation: independent verifiers (from the Sustainable Agricultural network) are commissioned to assess the performance of the Program and help qualify the underlying drivers of change and impacts.)

**Explanation of how you encourage implementation**

The AAA program, launched in 2003, is a sourcing program for quality coffee designed and implemented specifically for Nespresso in collaboration with the Rainforest Alliance. Through long-standing partnerships with farmers, coffee suppliers, and cooperatives, and with support from NGOs, it promotes the adoption of sustainable agricultural practices on the farm and landscape levels as well as improves the productivity and quality of harvests. Since 2014, the program has also aimed at innovating solutions for broader systemic challenges faced by the farming communities, such as climate change and price volatility. The benefits for producers are many: technical assistance, training, premium on quality, and inclusion in co-financed projects such as retirement savings plans and agroforestry. Thanks to the network of more than 400 agronomists, the program covers more than 120,000 producers in 15 countries. More than 30 partners are working in close collaboration for the implementation of the program and related projects: amongst other, the Federation of Coffee Growers in Colombia, Pur Projet for agroforestry.

**Climate change related benefit**

Emissions reductions (mitigation)
Increasing resilience to climate change (adaptation)
Increase carbon sink (mitigation)
Reduced demand for fertilizers (adaptation)
Reduced demand for pesticides (adaptation)
Other, please specify (Avoid soil degradation)

**Comment**

Nespresso sources a very specific coffee quality, buying from the same farmers every year. By the end of 2021, 92.6% of the coffee delivered to the Nespresso factories was sourced via AAA.

MP4

Management practice

Livestock management

**Description of management practice**

Our dairy supply chain is present in 27 countries and we also work with our supply chains through cooperatives around the world. Dairy and livestock are our single biggest source of emissions, so tackling them can have a major impact on our efforts to reach net zero. We leverage our R&D expertise in agricultural sciences, nutrition, food safety, analytics and product development to discover novel solutions that help us to further reduce carbon emissions in dairy. We are establishing research farms to test new solutions that will be upscaled across over 30 reference farms around the globe (see “Explanation of how you encourage implementation” field, below). Early results from these reference farms are very encouraging, opening the possibility for dairy farms to not only move toward net zero, but to potentially remove more carbon than they emit. We are not only piloting future farm models. In many cases, we have also accelerated existing programs in dairy to professionalize or support a just transition in our supply chain that takes into consideration the farms’ profitability. This scaling is about creating greater CO2 e reductions. The practices we look at include enriching animal diets, planting multi-species pasture, improved production management, biogas digesters, fertilizers and solar panels. Improving soil health is one of the best things we can do on farms. Building rich, deep, healthy soils has the potential to sequester carbon and to enhance water percolation and retention, which results in better climate resilience. All of this positively impacts the farms’ biodiversity by creating natural habitats for plants and animals. Soil health can be improved by reducing tillage, keeping the soil covered using cover crops such as oats, mustard, clover, peas, beans, amaranth or millet. Switching to multi-species pastures, planting trees and hedgerows, and establishing riparian buffers or silvopasture productions systems further improves the carbon footprint and biodiversity of the farms. Beyond this, when coupled with low-stress milk production systems managed by skilled people, the practices that are put in place to improve soil health can also boost milk production and with that farmers’ livelihoods.

**Your role in the implementation**

Financial
Knowledge sharing
Operational
Procurement

Other, please specify (Monitoring and evaluation: local partnership with universities to measure impact on selected pilot farms)

**Explanation of how you encourage implementation**

We are establishing research farms to test new solutions that will be upscaled across over 30 reference farms around the globe. On these farms, we test climate smart and regenerative agriculture practices with academic partners and the farming community in the respective geographic locations. Our aim is to transform these farms into net zero farms as a reference for others to learn from. Regional adaptation is important. The dairy footprint is an accumulation of emissions coming from different steps in the production system, each of which have a variety of practices. Equally, solutions need to take account of the best options to reduce and sequester carbon. Different farms will have several pathways to choose from based on personal preferences. To address this, we have identified 160 farming archetypes arranged into eight categorical clusters as a basis for localized pathways for market-led approaches. It is important for us to illustrate on existing farms what a transformation may look like in their region. These farms support the dialogue with our suppliers and help us to identify what further research, training, support tools and financing may be required. By doing this, we aim to remove uncertainties, minimize risk and reduce the hurdles to uptake.

**Climate change related benefit**

Emissions reductions (mitigation)
Increasing resilience to climate change (adaptation)
Increase carbon sink (mitigation)

Management practice
Knowledge sharing

Description of management practice
In South East Asia, for Nescafé, we are helping create a regenerative farming system through shade trees and an intercropping model on a pilot farm, together with partner GIZ through a public-private partnership. The objective is to validate the desired impact and demonstrate to farmers the relevance of the model. The farming system implemented takes into account a combination of different crops with the objective of generating environmental and economic benefits: enriching the soil by adding naturally nitrogen through growing beans between coffee rows, nurturing soils through plant diversity, generating additional income. The economic impact of smallholder systems is also documented for the first time (example Indonesia). Three countries will be covered with 10 500 farmers in total (Indonesia, Thailand, Philippines) as part of Nescafé Plan, and an agripreneurship training manual for coaching and training has been established.

Management practice
Permanent soil cover (including cover crops)

Description of management practice
Nestlé Purina is supporting the implementation of the Truterra Insights Engine on 50,000 acres to improve environmental stewardship and farm profitability on 81 family farms. The Truterra tool utilizes 110 field data inputs to generate outcome-based measurements of multiple farming practices culminating in an overall score for the farm. Central to the outcome is the measurement of net GHG emissions from the farm. Utilizing this information, the farmer working closely with their agronomic advisor can recommend changes that benefit the environment while balancing the profitability of the farm.

Your role in the implementation
Financial
Knowledge sharing
Procurement

Explanation of how you encourage implementation
The agronomic advisor is the trusted crop advisor that farmers are willing to listen to as they make decisions on materials and practices used on their farms (e.g. seeds, fertilizer, stabilizers, tilling, planting, harvesting, etc). By providing the Truterra Insight Engine to the advisors as well as funding the use of the tool, the crop advisors are able to work directly with the farmers to input their field data and provide deep insights into their operations. This also is a pathway to allow farmers to measure with great accuracy the environmental outcomes on their farms and verify these outcomes for purchase on the market in the future.

Description of management practice
As part of our long-term involvement in sustainable coffee production in Vietnam, Nestlé has been engaged since 2011 in increasing the resilience to climate change of smallholder coffee farming. As irrigation is a key activity to achieve yields of more than 3 Mt / ha, it is important to ensure water usage can be accomplished with sustainable volumes. Key milestones achieved so far included the following: • Conducted hydrological studies / knowledge sharing on water dynamics in the Central highlands in view of climate change • Developed recommendations / practices for efficient irrigation practices with 40% less water vs. previous practices • 50 000 farmers trained as part of a PPP with the Swiss Development Cooperation (SDC) • 20 000 farmers trained as part of our direct supply chain (our Farmer Connect program) • Farmer training programs resulted in an annual reduction of 50 million m3 of water • Developed as part of SDC PPP a weather app for smallholder farmers, helping them to predict rainfall / helping farmers decision on timing on irrigation

C-AC12.2b/C-FB12.2b/C-PF12.2b

(C-AC12.2b/C-FB12.2b/C-PF12.2b) Do you collect information from your suppliers about the outcomes of any implemented agricultural/forest management practices you have encouraged?
Yes

C12.3

(C12.3) Does your organization engage in activities that could either directly or indirectly influence policy, law, or regulation that may impact the climate?

Row 1
Direct or indirect engagement that could influence policy, law, or regulation that may impact the climate
Yes, we engage directly with policy makers
Yes, we engage indirectly through trade associations
Yes, we engage indirectly by funding other organizations whose activities may influence policy, law, or regulation that may significantly impact the climate

Does your organization have a public commitment or position statement to conduct your engagement activities in line with the goals of the Paris Agreement?
Yes

Attach commitment or position statement(s)
https://www.nestle.com/sustainability/climate-change/advocacy
climate-change-action-advocacy-position-principles.pdf

Describe the process(es) your organization has in place to ensure that your engagement activities are consistent with your overall climate change strategy
All of Nestlé's advocacy activities on climate align with the ambitions of the Paris Agreement. This includes our work related to multi-stakeholder and business only coalitions and trade associations. Nestlé S.A. has developed climate legislative advocacy guidance on climate change (attached) for all our local and regional teams. The document underlines our commitment to carrying out climate advocacy activities in line with the Paris Agreement, whether globally or locally. We also apply our Policy on Transparent Interactions with Public Authorities (pdf, 2Mb). Disclosure of our advocacy practices is important to enhance transparency and trust, we therefore make publicly available: 1. Our advocacy priorities on climate 2. A disclosure of Nestlé S. A.’s memberships of private sector-led and multi-stakeholder coalitions related to these priorities 3. Nestlé’s climate legislative advocacy guidance 4. Links to other public disclosures of Nestlé’s advocacy activities 5. Examples of our global and regional advocacy activities Our climate advocacy priorities are: 1) clear and fair rules for Natural Climate Solutions (insetting), Carbon Market & Pricing and offsetting, Disclosure & Reporting, and Environmental Claims); 2) Policies to transform Agriculture, Energy, Logistics, and Packaging. Each Climate Advocacy Priority is led by one cross-functional working group, responsible for defining the corporate positions and strategies on the topic, validated by a Climate Advocacy Group at the global level. Implementation of these strategies is led by these working groups at global and regional level and by the local businesses, at country level.

Primary reason for not engaging in activities that could directly or indirectly influence policy, law, or regulation that may impact the climate
<Not Applicable>

Explain why your organization does not engage in activities that could directly or indirectly influence policy, law, or regulation that may impact the climate
<Not Applicable>

C12.3a
On what policy, law, or regulation that may impact the climate has your organization been engaging directly with policy makers in the reporting year?

**Focus of policy, law, or regulation that may impact the climate**
- Climate-related targets

**Specify the policy, law, or regulation on which your organization is engaging with policy makers**
Nestlé supports strong and bold "Nationally Determined Contributions" ("NDCs") that align with the 1.5-degree pathway.

**Policy, law, or regulation geographic coverage**
- National

**Country/region the policy, law, or regulation applies to**
- Japan
- Philippines
- United States of America
- Europe

**Your organization’s position on the policy, law, or regulation**
- Support with no exceptions

**Description of engagement with policy makers**
Nestlé supports strong and bold "Nationally Determined Contributions" ("NDCs") that align with the 1.5-degree pathway. We also encourage governments to translate their NDCs and other "Conference of the Parties" (COP) commitments into national/regional legislation to ensure execution of these ambitions and, therefore, deliver meaningful climate action. Nestlé has engaged in market-level advocacy that includes linking our Net Zero ambition with Nationally Determined Contributions (NDCs) in the Philippines, for example.

**Details of exceptions (if applicable) and your organization’s proposed alternative approach to the policy, law or regulation**
<Not Applicable>

**Have you evaluated whether your organization’s engagement is aligned with the goals of the Paris Agreement?**
Yes, we have evaluated, and it is aligned

---

**Focus of policy, law, or regulation that may impact the climate**
- Mandatory climate-related reporting

**Specify the policy, law, or regulation on which your organization is engaging with policy makers**
Proposed mandatory climate reporting requirements

**Policy, law, or regulation geographic coverage**
- National

**Country/region the policy, law, or regulation applies to**
- United Kingdom of Great Britain and Northern Ireland

**Your organization’s position on the policy, law, or regulation**
- Support with no exceptions

**Description of engagement with policy makers**
Nestle seeks to define and develop advocacy positions based on a deeper understanding of the regulatory requirements, evolution and the proliferation of investor/stakeholder indices. Areas being considered: • Seeking harmonization of reporting and disclosure requirements: avoiding duplications and overlapping standards, country breakdowns vs global reporting. • Better adaptation of the standards to industry-specific realities to foster the most accurate illustration of food and beverage company efforts. • In addition, stronger alignment on the use of materiality to select what companies report, rather than standards and frameworks that take a one-size-fits-all approach.

**Details of exceptions (if applicable) and your organization’s proposed alternative approach to the policy, law or regulation**
<Not Applicable>

**Have you evaluated whether your organization’s engagement is aligned with the goals of the Paris Agreement?**
Yes, we have evaluated, and it is aligned

---

**Provide details of the trade associations your organization engages with which are likely to take a position on any policy, law or regulation that may impact the climate.**

**Trade association**
International Chamber of Commerce (ICC)

**Is your organization’s position on climate change consistent with theirs?**
Consistent

**Has your organization influenced, or is your organization attempting to influence their position?**
We publicly promote their current position

**State the trade association’s position on climate change, explain where your organization’s position differs, and how you are attempting to influence their position (if applicable)**
The ICC recognizes the urgent need to keep the global temperature increase below 1.5° Celsius and achieve net-zero emissions by 2050. We support this position and are advocating for the full inclusion of food systems in climate mitigation and adaptation plans.

**Funding figure your organization provided to this trade association in the reporting year, if applicable (currency as selected in C0.4) (optional)**
<Not Applicable>

**Describe the aim of your organization’s funding**
<Not Applicable>

**Have you evaluated whether your organization’s engagement with this trade association is aligned with the goals of the Paris Agreement?**
Yes, we have evaluated, and it is aligned
Trade association
Sustainable Agriculture Initiative Platform (SAIP)

Is your organization’s position on climate change consistent with theirs?
Consistent

Has your organization influenced, or is your organization attempting to influence their position?
We publicly promote their current position

State the trade association’s position on climate change, explain where your organization’s position differs, and how you are attempting to influence their position (if applicable)
SAI Platform is committed to helping to create a future where people, the planet and sustainable business solutions come together to ensure a viable and resilient agricultural sector.

Funding figure your organization provided to this trade association in the reporting year, if applicable (currency as selected in C0.4) (optional)

Describe the aim of your organization’s funding
<Not Applicable>

Have you evaluated whether your organization’s engagement with this trade association is aligned with the goals of the Paris Agreement?
Yes, we have evaluated, and it is aligned

---

Trade association
Other, please specify (Food Drink Europe)

Is your organization’s position on climate change consistent with theirs?
Consistent

Has your organization influenced, or is your organization attempting to influence their position?
We publicly promote their current position

State the trade association’s position on climate change, explain where your organization’s position differs, and how you are attempting to influence their position (if applicable)
The EU food and drink industry is committed to the EU's target for a carbon-neutral Europe by 2050. Nestle participates in the Environmental Information and PEF Task Force, through which Food Drink Europe aims to reduce greenhouse gas emissions and support farmers to adopt more sustainable farming practices to combat climate change. Nestle's advocacy aims are: • Implementation of internationally recognized standards (regionally harmonized scheme for Europe) that allow companies and brands to make environmental footprint related claims in a clear and credible way. • Promote fair competition, increase consumer trust, empowerment and drive real change aligned with local aspirations and F&B industry commitments to reducing environmental footprint.

Funding figure your organization provided to this trade association in the reporting year, if applicable (currency as selected in C0.4) (optional)

Describe the aim of your organization’s funding
<Not Applicable>

Have you evaluated whether your organization’s engagement with this trade association is aligned with the goals of the Paris Agreement?
Yes, we have evaluated, and it is aligned

---

Trade association
Other, please specify (EUROPEN)

Is your organization’s position on climate change consistent with theirs?
Consistent

Has your organization influenced, or is your organization attempting to influence their position?
We publicly promote their current position

State the trade association’s position on climate change, explain where your organization’s position differs, and how you are attempting to influence their position (if applicable)
EUROPEN members are committed to the climate neutrality goals of Europe’s new sustainable growth strategy, the European Green Deal, and fully support the new EU Circular Economy Action Plan. Nestle participates in the EUROPEN’s Environmental Information Working Group. Nestle’s advocacy aims are: • Implementation of internationally recognized standards (regionally harmonized scheme for Europe) that allow companies and brands to make environmental footprint related claims in a clear and credible way. • Promote fair competition, increase consumer trust, empowerment and drive real change aligned with local aspirations and F&B industry commitments to reducing environmental footprint.

Describe the aim of your organization’s funding
<Not Applicable>

Have you evaluated whether your organization’s engagement with this trade association is aligned with the goals of the Paris Agreement?
Yes, we have evaluated, and it is aligned

---

Trade association
Other, please specify (World Business Council for Sustainable Development)

Is your organization’s position on climate change consistent with theirs?
Consistent

Has your organization influenced, or is your organization attempting to influence their position?
We publicly promote their current position

State the trade association’s position on climate change, explain where your organization’s position differs, and how you are attempting to influence their position (if applicable)
Nestle is a member of the WBCSD and the Executive Vice President Global Head of Operations, Nestlé is a member of the WBCSD executive committee. The EVP Global Head of Operations also co-chairs the WBCSD’s Food and Nature board and chairs this board as of January 2022. Nestle participates in multiple climate-related initiatives led by WBCSD, including: • SOS 1.5, a cross-sectorial framework hosted by WBCSD to help companies transform their operations and align with 1.5°C. • OP2B, a coalition to drive transformational systemic change and catalyzes action to protect and restore cultivated and natural biodiversity within value chains. OP2B develops and promotes
policy recommendations for the COP 15 CBD framework. - The Soils Investment Club, a resource for knowledge connecting business to existing platforms that can mobilize finance, engage with farmers for value chain collaboration. - Scaling Positive Agriculture, for maximizing the potential of agriculture as a solution for climate, nature and farmers.

Funding figure your organization provided to this trade association in the reporting year, if applicable (currency as selected in C0.4) (optional)

Describe the aim of your organization’s funding

<Not Applicable>

Have you evaluated whether your organization’s engagement with this trade association is aligned with the goals of the Paris Agreement?

Yes, we have evaluated, and it is aligned

C12.3c

(C12.3c) Provide details of the funding you provided to other organizations in the reporting year whose activities could influence policy, law, or regulation that may impact the climate.

Other, please specify (International organization for public-private cooperation)

State the organization to which you provided funding

World Economic Forum

Funding figure your organization provided to this organization in the reporting year (currency as selected in C0.4)

Describe the aim of this funding and how it could influence policy, law or regulation that may impact the climate

Nestlé is a member of the WEF CEO Climate Leaders Alliance, through which we undertake climate advocacy as a critical part of our Net Zero Roadmap, helping to create the right frameworks and conditions for efforts to reduce emissions.

Have you evaluated whether this funding is aligned with the goals of the Paris Agreement?

Yes, we have evaluated, and it is aligned

Type of organization

Other, please specify (Business coalition)

State the organization to which you provided funding

One Planet Business for Biodiversity (OP2B)

Funding figure your organization provided to this organization in the reporting year (currency as selected in C0.4)

Describe the aim of this funding and how it could influence policy, law or regulation that may impact the climate

This coalition drives transformational systemic change and catalyzes action to protect and restore cultivated and natural biodiversity within value chains. OP2B develops and promotes policy recommendations for the COP 15 CBD framework. Nestlé is a member of its advocacy working group.

Have you evaluated whether this funding is aligned with the goals of the Paris Agreement?

Yes, we have evaluated, and it is aligned

C13. Other land management impacts

---

C-AC13.2/C-FB13.2/C-PF13.2.2

Do you know if any of the management practices mentioned in C-AC12.2a/C-FB12.2a/C-PF12.2a that were implemented by your suppliers have other impacts besides climate change mitigation/adaptation?

Yes
Management practice reference number
MP1
Overall effect
Positive
Which of the following has been impacted?
Biodiversity
Soil
Water
Yield

Description of impacts
Our Global Reforestation Program projects will include growing trees to help restore natural forest landscapes, introducing agroforestry systems for suitable crops such as cocoa and coffee, and supporting other natural ecosystem restoration activities. The projects are expected to have co-benefits, including helping to improve soil health and water conservation, restoring degraded lands, contributing to biodiversity, mitigating climate change and supporting local livelihoods and the rights of Indigenous People and Local Communities. To date, our projects have secured a total of 24.6 million trees for planting in regions we source from, contributing toward our overall reforestation goal with 9.3 million tonnes of CO2e removals initiated over project lifetimes.

Have any response to these impacts been implemented?
Yes

Description of the response(s)
Our Global Reforestation Program is part of our Forest Positive strategy. Launched in June 2021, our Forest Positive strategy builds on our decade-long work to end deforestation in our supply chains. Forest Positive is our strategy to move beyond managing deforestation risks in our supply chain to targeting a positive impact on our broader sourcing landscapes. Our strategy aims to help conserve and restore forests and natural ecosystems while promoting sustainable livelihoods and respecting human rights, including empowering Indigenous Peoples and Local Communities to be stewards of critical natural ecosystems. Understanding the drivers of deforestation and creating the right incentives for forest conservation and the preservation of natural ecosystems are key to our approach. This is why we will go beyond our supply chain. Our actions will include rewarding suppliers for practices that keep trees standing, regenerate the land and respect human rights.

Management practice reference number
MP2
Overall effect
Positive
Which of the following has been impacted?
Biodiversity
Soil
Water
Yield

Description of impacts
Nestlé is involved with the Earthworm Foundation’s Living Soils Initiative (Projet Sols Vivant) works with 30 farmers producing potatoes, sugar beet, wheat and vegetables in the north of France, providing technical support and financial tools to help the farmers improve soil health and, in doing so, hold more carbon in the soil. Retaining carbon not only prevents carbon dioxide from being released into the atmosphere, where it can contribute to climate change, but also enhances water retention and helps release nutrients for plant growth, increasing crop yields.

Have any response to these impacts been implemented?
Yes

Description of the response(s)
Several local partners have been contracted to provide focused trainings and coaching to farmers who are part of the initiative. In addition, farmers who are part of the “preference” sustainability scheme (a related program to implement sustainable practices) receive a price premium to reward the implementation of a set of selected practices.

Management practice reference number
MP4
Overall effect
Positive
Which of the following has been impacted?
Biodiversity
Soil
Water

Description of impacts
We are establishing research farms to test new solutions that will be upscaled across over 30 reference farms around the globe. Improving soil health is one of the best things we can do on farms. Building rich, deep, healthy soils has the potential to sequester carbon and to enhance water percolation and retention, which results in better climate resilience. All of this positively impacts the farms’ biodiversity by creating natural habitats for plants and animals.

Have any response to these impacts been implemented?
Yes

Description of the response(s)
Soil health can be improved by reducing tillage, keeping the soil covered using cover crops such as oats, mustard, clover, peas, beans, amaranth or millet. Switching to multi-species pastures, planting trees and hedgerows, and establishing riparian buffers or silvopasture productions systems further improves the carbon footprint and biodiversity of the farms. Beyond this, when coupled with low-stress milk production systems managed by skilled people, the practices that are put in place to improve soil health can also boost milk production and with that farmers’ livelihoods.
C15. Biodiversity

C15.1

(C15.1) Is there board-level oversight and/or executive management-level responsibility for biodiversity-related issues within your organization?

<table>
<thead>
<tr>
<th>Board-level oversight and/or executive management-level responsibility for biodiversity-related issues</th>
<th>Description of oversight and objectives relating to biodiversity</th>
<th>Scope of board-level oversight</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes, both board-level oversight and executive management-level responsibility</td>
<td>At Board level, as of the Annual General Meeting 2021, Nestlé split its existing Nomination and Sustainability Committee into a separate Nomination Committee and a dedicated Sustainability Committee. This reflects the importance of sustainability in Nestlé’s corporate governance and allows Board members to dedicate more time and focus to each of these important topics. The Sustainability Committee provides strategic guidance on sustainability-related matters including our Forest Positive strategy, which aims to help conserve and restore forests and natural ecosystems, and reports to the full Board of Directors, which has overall oversight. The Sustainability Committee of the Board meets at least three times per year. It reviews the Company's commitments on environmental, social and governance aspects as well as the annual Creating Shared Value report and discusses periodically how other material non-financial risks affect the Company's financial performance and how its long-term strategy relates to its ability to create shared value. An Environmental, Social and Governance (ESG) Sustainability Council has been established at the Executive Board level. The ESG Sustainability Council provides governance, strategic leadership and execution support. It drives implementation of Nestlé’s sustainability strategy, including implementation of our 2050 Net Zero Roadmap, ensuring focus and alignment on execution.</td>
